

Mid-Latitude Stratospheric Chemistry

AOSC 433/633 & CHEM 433

Ross Salawitch

Class Web Site: <http://www.atmos.umd.edu/~rjs/class/spr2017>

Today:

- Importance of how a chemical cycle is completed wrt odd-oxygen loss
- Role of halogens and aerosol loading on mid-latitude ozone
- Connection to recent research

Lecture 14

30 March 2017

Ozone Depletion and Halocarbons

Table Q7-1. Atmospheric Lifetimes and Ozone Depletion Potentials of some halogen source & HFC substitute gases.

Gas	Atmospheric Lifetime (years)	Ozone Depletion Potential (ODP) ^c
Halogen source gases		
Chlorine gases		
CFC-11	45	1
CFC-12	100	0.82
CFC-113	85	0.85
Carbon tetrachloride (CCl ₄)	26	0.82
HCFCs	1–17	0.01–0.12
Methyl chloroform (CH ₃ CCl ₃)	5	0.16
Methyl chloride (CH ₃ Cl)	1	0.02
Bromine gases		
Halon-1301	65	15.9
Halon-1211	16	7.9
Methyl bromide (CH ₃ Br)	0.8	0.66
Hydrofluorocarbons (HFCs)		
HFC-134a	13.4	0
HFC-23	222	0

$$\text{ODP (species "i")} = \frac{\text{global loss of O}_3 \text{ due to unit mass emission of "i"}}{\text{global loss of O}_3 \text{ due to unit mass emission of CFC-11}}$$

$$\approx \frac{(\alpha n_{\text{Br}} + n_{\text{Cl}})}{3} \frac{\tau_i}{\tau_{\text{CFC-11}}} \frac{MW_{\text{CFC-11}}}{MW_i}$$

continuous

continuous

where :

τ is the global atmospheric lifetime

MW is the molecular weight

n is the number of chlorine or bromine atoms

α is the effectiveness of ozone loss by bromine relative to ozone loss by chlorine

$$\alpha = 60$$

Halons (anthropogenic halocarbons containing bromine) much worse for ozone than CFCs (anthropogenic halocarbons containing chlorine)

Montreal Protocol and Various Amendments Have Banned Industrial Production of CFCs and Halons

And Atmospheric Levels of these Pollutants are Declining

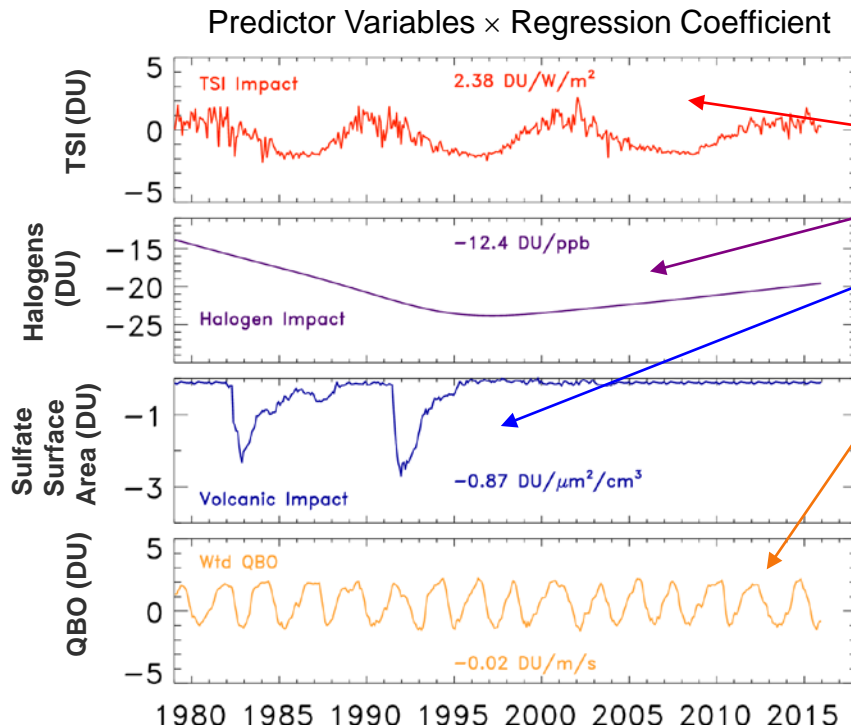

Ozone Depletion at Mid-Latitudes

Ozone data from

http://acdb-ext.gsfc.nasa.gov/Data_services/merged

Column Ozone Anomaly (DU) =

$$19.6 \text{ DU} + 2.38 \text{ DU} / \text{W m}^{-2} \times \text{TSI} + -12.4 \text{ DU} / \text{ppb} \times \text{Halogens} + -0.87 \text{ DU} \times \ln(\text{SSA}) + -0.02 \text{ DU} / \text{m s}^{-1} \times \text{QBO}$$

where

- TSI = total solar irradiance
- Halogens = stratospheric chlorine & bromine loading
- SSA = Sulfate Surface Area
- QBO = Quasi-biennial oscillation of the direction of winds in the tropical lower strat

Chapman Chemistry

$$[\text{O}_3] = \left(\frac{J_1 k_2}{J_3 k_4} \right)^{1/2} f_{\text{O}_2} [\text{M}]^{3/2}$$

FIGURE 4.6 Comparison of stratospheric ozone concentrations as a function of altitude as predicted by the Chapman mechanism and as observed over Panama (9° N) on November 13, 1970.

$[\text{O}_3]$ falls off with increasing altitude (high in stratosphere), at a rate determined by $[\text{M}]^{3/2}$, because:

$[\text{O}_3]$ falls off with decreasing altitude (low in stratosphere) due to a rapid drop in J_1 , reflecting:

Observed $[\text{O}_3] <$ Chapman $[\text{O}_3]$: why !?!

Lecture 9

Stratospheric Photochemistry: Odd Oxygen Loss By Families

Fraction of O_x Loss Due to Each Catalytic Family
JPL 2002 Kinetics
35°N, Sept

Calculated fraction of Ozone loss due to various family of radicals.

After Osterman et al., GRL, 1997.

Lecture 9

HO_x : OH and HO₂

OH and HO₂ are central to stratospheric and tropospheric photochemistry

HO_x : OH and HO₂

OH and HO₂ are central to stratospheric and tropospheric photochemistry

Rapid inner cycle:

HO₂ formation:

HO₂ loss:

HO_x : OH and HO₂

OH and HO₂ are central to stratospheric and tropospheric photochemistry

Rapid inner cycle:

HO₂ formation:

HO₂ loss:

HO₂ loss step (2):

This is followed quickly by:

Yielding final “net”:

Null cycle

with respect to production & loss of odd oxygen

HO_x : OH and HO₂

OH and HO₂ are central to stratospheric and tropospheric photochemistry

Rapid inner cycle:

HO₂ formation:

HO₂ loss:

HO₂ loss step (3):

HO₂ loss step (4):

Catalytic Ozone (Odd Oxygen) Loss Cycles

Odd Oxygen Loss - HO_x

$$\frac{d(\text{Odd Oxygen})}{dt} = -2 k_4 [\text{HO}_2][\text{O}_3] - 2 k_3 [\text{HO}_2][\text{O}] \quad \text{Eq (7)}$$

The reactions:

are rate limiting steps for O₃ loss by two catalytic cycles:

Cycle (1) Net :

Cycle (2) Net :

As a convenient short hand, **we consider HO₂ to be odd oxygen**

Then:

clear now that reactions (3) and (4) each consume two odd oxygens at rates determined by $2 k_3 [\text{HO}_2][\text{O}]$ and $2 k_4 [\text{HO}_2][\text{O}_3]$

OH, HO₂, H₂O, and CH₄

Odd Oxygen Loss - HO_x

At what altitudes will loss of ozone by these rate limiting steps be dominant ?

One dominates at low altitude, the other at high altitude \Rightarrow which is which !?

Fraction of O_x Loss Due to Each Catalytic Family
JPL 2002 Kinetics
35°N, Sept

NO_x : NO and NO₂

NO and NO₂ are central to stratospheric and tropospheric photochemistry

Stratospheric Production : O¹D + N₂O → NO + NO

Final sinks : N + NO → N₂ + O (uppermost stratosphere)
HNO₃ solubility & rainout (lowermost stratosphere)

NO_x : NO and NO₂

NO and NO₂ are central to stratospheric and tropospheric photochemistry

Rapid inner cycle:

NO₂ formation:

NO₂ loss:

NO₂ loss step (2):

NO₂ loss step (3):

Can show:

$$\frac{d\text{O}_3}{dt} + \frac{d\text{O}}{dt} = \frac{d(\text{Odd Oxygen})}{dt} = -2k_3[\text{NO}_2][\text{O}]$$

As a convenient short hand, **we consider NO₂ to be odd oxygen**

NO_y versus N₂O

Figure 6-8, WMO (1999)

N₂O and Stratospheric Ozone

Revell *et al.*, *ACP*, 2012

Stratospheric O₃ difference in the 2090s found for a computer simulation run using N₂O from RCP 8.5 minus that of a simulation using N₂O from RCP 2.6

Rising N₂O leads to:

- a) ozone loss in the middle & upper stratosphere by increasing the speed of NO and NO₂ (NO_x) mediated loss cycles.
- b) speeds up the rate of OH+NO₂+M→HNO₃+M & ClO+NO₂+M→ClONO₂+M in the lowermost stratosphere, leading to slower ozone loss by these cycles & therefore more O₃ where these cycles dominate total loss of O₃

Computer models project stratospheric column O₃ will decline as N₂O rises

Future ODP of N₂O depends on CH₄ & CO₂

ODP of N₂O in year 2100 found by a Swiss three dimensional, chemistry climate model called SOCOL (Solar Climate Ozone Links)

Revell et al., GRL, 2015

ClO_x : ClO and Cl

ClO is central to stratospheric photochemistry, at mid-latitudes and polar regions

Production : CFCs $+h\nu \rightarrow$ Inorganic chlorine

Final sinks : HCl solubility & rainout (lowermost stratosphere)

ClO_x : ClO and Cl

ClO is central to stratospheric photochemistry, at mid-latitudes and polar regions:

Rapid inner cycle:

ClO formation:

ClO loss:

ClO loss step (2):

ClO loss step (3):

Can show:

$$\frac{d\text{O}_3}{dt} + \frac{d\text{O}}{dt} = \frac{d(\text{Odd Oxygen})}{dt} = -2 k_3 [\text{ClO}][\text{O}]$$

As a convenient short hand, **we consider ClO to be odd oxygen**

Proof Halocarbons Reach The Stratosphere

Zander *et al.*, *GRL*, 1996

Trends in Ozone, ~40 km

Grey: range of model calculations, where models are forced by rising levels of stratospheric halogens

Trends in ozone at 40 km are “well understood” ozone generally anti-correlates with time history of stratospheric chlorine loading

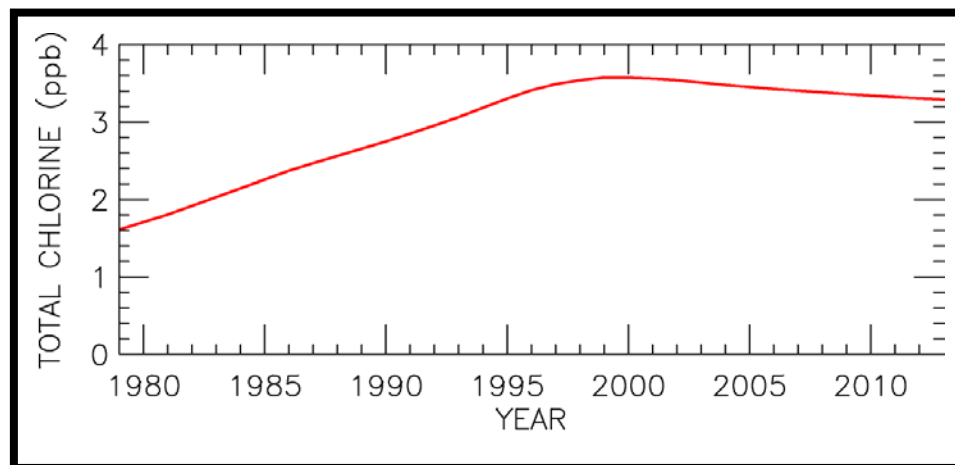

Figure 2-5, WMO/UNEP 2010

Trends in Ozone vs Altitude

Trends in ozone as a function of latitude and altitude, for the time period 1979 to 2005, from the NASA SAGE I & SAGE II instruments. Shaded region indicates significance at the 2σ level.

Figure 2-4, WMO/UNEP 2010

Two complications to understanding ozone trends in the lower stratosphere: aerosol surface area and bromine

Bromine Source Gases

Total Column Ozone Time Series, NH

Stratospheric aerosol loading,

Deshler et al., 2003.

Stratospheric chlorine

Change in ozone column relative to 1980, 35 to 60°N

WMO/UNEP 2006 Ozone Report

Chemical reaction on surface of volcanic aerosol couples NO_2 and HNO_3

- As sulfate aerosol rises, NO_x (NO and NO_2) falls
- As NO_2 drops, ClNO_2 falls and ClO rises

Ozone responds to:

- rise and fall of chlorine
- volcanic perturbations to aerosol loading
- amount of bromine in lowermost stratosphere

Salawitch *et al.*, *GRL*, 2005

EXCESS SKIN CANCER CASES
IN THE UNITED STATES,
PER YEAR, DUE TO OZONE DEPLETION
FOR VARIOUS CFC SCENARIOS

Longstreth *et al.*, *J. of Photochemistry and Photobiology B*, 46, 20–39, 1998.

See also Slaper *et al.*, Estimates of ozone depletion and skin cancer incidence to examine the Vienna Convention achievements, *Nature*, 384, 256–258, 1996, who state:

The no-restrictions and Montreal Protocol scenarios produce a runaway increase in skin cancer incidence, up to a quadrupling and doubling, respectively, by year 2100.
