Announcements

Interesting presentation on Wed, 24 April, 5:45 pm, ATL 2400

Preceded by a reception (⇒ free food) starting at 5:00 pm

attendance is voluntary

Seminar will be ~an hour long

Ocean Acidification and Rising Ocean Temperature Impacts on Marine Ecosystems

Prof. Scott C. Doney

University of Virginia

What is the relationship between ocean acidification and rising temperatures and how do those phenomena affect sealife? How does ocean pollution exacerbate these environmental stressors and increase the susceptibility of marine organisms to disease and habitat disruptions? What is the future of marine ecosystems based on model predictions? These are among the many questions raised by the changing climate.

Chlorophyll concentration in the western North Atlantic in late-April, 2018 from the NASA MODIS Aqua satellite

3

Announcements

Will show Ozone Hole documentary on Thurs, 25 April, 6:00 pm, ATL 3400:

attendance is voluntary

Documentary is 55 minutes long

Ozone Hole: How We Saved the Planet

OZONE HOLE: HOW WE SAVED THE PLANET
Courtesy of Windfall Films/NASA

Premieres Wednesday, April 10, 2019

10:00-11:00 p.m. ET on PBS

New Documentary Tells the Remarkable Story of How Scientists Discovered the Deadly Hole in the Ozone – and the Even More Remarkable Story of How the World's Leaders Came Together to Fix It

<https://www.pbs.org/video/ozone-hole-how-we-saved-the-planet-ttwe2l>

4

AT 17

Combustion of 1 gram of CH_4 results of 50.1 kJ of energy

Combustion of 1 gram of C results in 32.8 kJ of energy

Therefore, we might conclude natural gas is $50.1 / 32.8 = 1.53$ times more efficient, which I would right as 53% more efficient.

However, combustion of 1 gram of C results in $32/12 + 1 = 3.667$ gram of CO_2

whereas combustion of 1 gram of CH_4 results in $12/16 (32/12+1) = 2.75$ gram of CO_2

To place natural gas and coal (pure C) on equal footing, must first multiply energy yield from natural gas by $(3.667/2.75) = 1.33$, so that atmospheric CO_2 produced by both processes is identical.

We find natural gas is $1.33 \times 50.1 / 32.8 = 2.0$; i.e., about 100% more efficient than coal.

Fig 4.26. Energy differences (in kJ/g) for the combustion of methane (CH_4), n-octane (C_8H_{18}), coal (assumed to be pure carbon), ethanol ($\text{C}_2\text{H}_5\text{OH}$), and wood (assumed to be glucose).

5

AT 17

Combustion of 1 gram of CH_4 results of 50.1 kJ of energy

Combustion of 1 gram of C results in 32.8 kJ of energy

Alas, coal is not pure carbon in the real world. Rather, notational formula for coal is $\text{C}_{135}\text{H}_{96}\text{O}_9\text{NS}$ (page 162 of Chemistry in Context): i.e., coal has a carbon content of 85% by mass.

Therefore, we'd state:

natural gas is actually $1.33 \times 50.1 / (32.8/0.85) = 1.73$; i.e., 73% more efficient than coal.

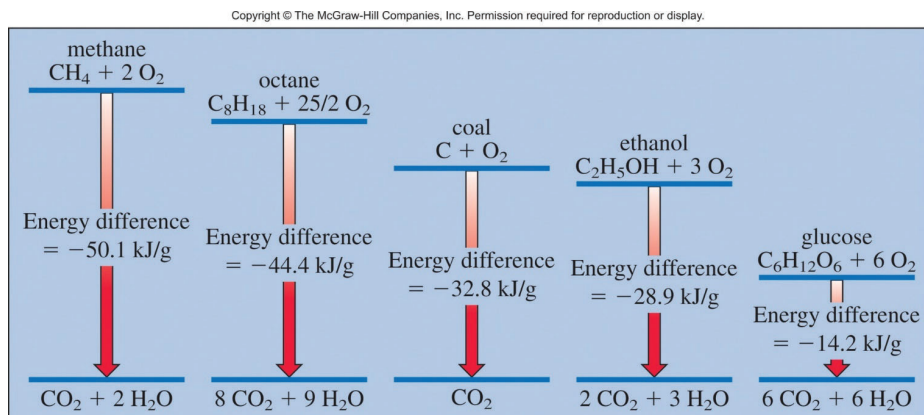

Fig 4.26. Energy differences (in kJ/g) for the combustion of methane (CH_4), n-octane (C_8H_{18}), coal (assumed to be pure carbon), ethanol ($\text{C}_2\text{H}_5\text{OH}$), and wood (assumed to be glucose).

6

Future Use of Fossil Fuels

Table shown last lecture

Fossil Fuel	GHG Output (pounds CO ₂ per kWh)
Oil Sands	5.6
Coal	2.1
Oil	1.9
Gas	1.3

Natural gas produces $(1/1.3) / (1/2.1) = 1.61$; i.e., 61% more energy than coal, per CO₂ released

Natural gas produces $(1/1.3) / (1/5.6) = 4.3$; i.e., more than 4× more energy than oil sands, per CO₂ released

http://www.eia.doe.gov/cneaf/electricity/page/co2_report/co2report.html

8

Kyoto Protocol

- Negotiated in Kyoto, Japan in November 1997
 - Annex I countries: Developed countries (Table 10.1 of Houghton) with varying emission targets, 2008-2012 relative to 1990, ranging from +10% (Iceland) to –8% (EU-15)

Table 10.1 Emissions targets (1990*–2008/2012) for greenhouse gases under the Kyoto Protocol

Country	Target (%)
EU-15**, Bulgaria, Czech Republic, Estonia, Latvia, Lithuania, Romania, Slovakia, Slovenia, Switzerland	–8
USA***	–7
Canada, Hungary, Japan, Poland	–6
Croatia	–5
New Zealand, Russian Federation, Ukraine	0
Norway	+1
Australia	+8
Iceland	+10

* Some economies in transition (EIT) countries have a baseline other than 1990.
 ** The fifteen countries of the European Union have agreed an average reduction; changes for individual countries vary from –28% for Luxembourg, –21% for Denmark and Germany to +25% for Greece and +27% for Portugal.
 *** The USA has stated that it will not ratify the Protocol.

9

Kyoto Protocol

- Negotiated in Kyoto, Japan in November 1997
 - Annex I countries: Developed countries (Table 10.1 of Houghton) with varying emission targets, 2008-2012 relative to 1990, ranging from +10% (Iceland) to –8% (EU-15)
 - Annex II countries: sub-group of Annex I countries that agree to pay cost of technology for emission reductions in developing countries
 - Australia, Austria, Belgium, Canada, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Japan, Luxembourg, Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, United Kingdom, United States of America
 - Developing countries: all countries besides those in Table 10.1 of Houghton
 - Went into effect in 16 February 2005 after signed by _____
- Annex I countries:
 - agree to reduce GHG emissions to target tied to 1990 emissions. If they cannot do so, they must buy emission credits or invest in conservation
- Developing countries:
 - no restrictions on GHG emissions
 - encouraged to use new technology, funded by Annex II countries, to reduce emissions
 - can not sell emission credits

10

Kyoto Protocol

KYOTO PROTOCOL TO THE UNITED NATIONS FRAMEWORK CONVENTION ON CLIMATE CHANGE

UNITED NATIONS

1998

Article 3

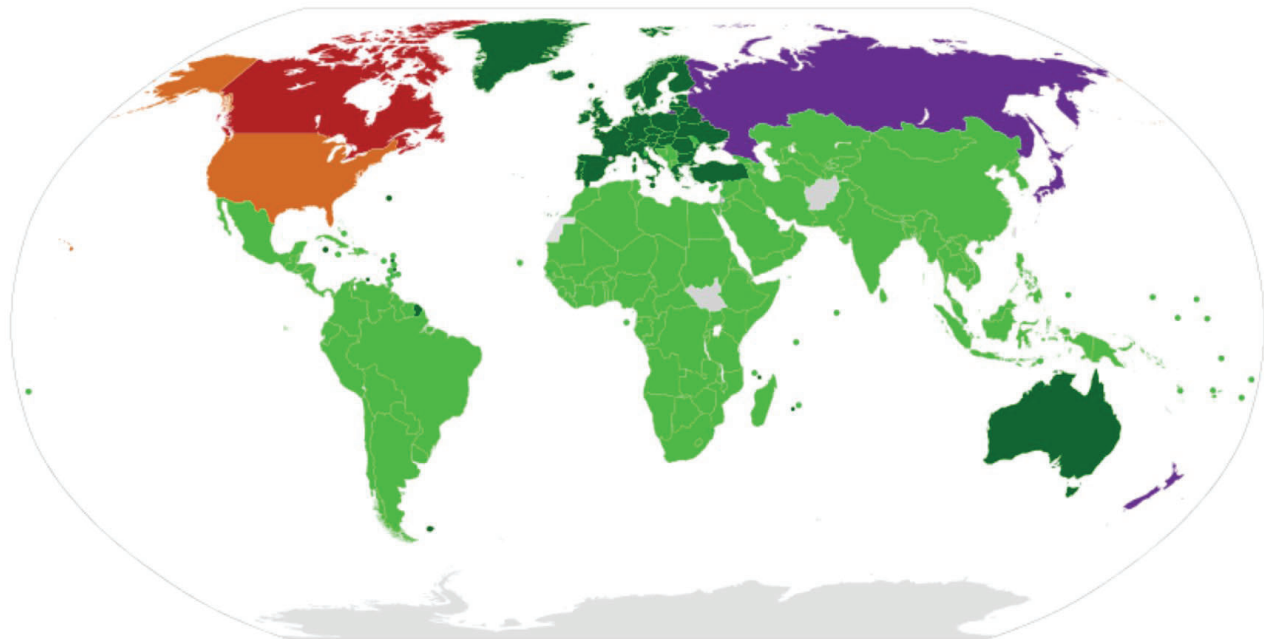

1. The Parties included in Annex I shall, individually or jointly, ensure that their aggregate anthropogenic carbon dioxide equivalent emissions of the greenhouse gases listed in Annex A do not exceed their assigned amounts, calculated pursuant to their quantified emission limitation and reduction commitments inscribed in Annex B and in accordance with the provisions of this Article, **with a view to reducing their overall emissions of such gases by at least 5 per cent below 1990 levels in the commitment period 2008 to 2012.**
2. Each Party included in Annex I shall, by 2005, have made demonstrable progress in achieving its commitments under this Protocol.
3. The **net changes in greenhouse gas emissions by sources and removals by sinks resulting from direct human-induced land-use change and forestry activities, limited to afforestation, reforestation and deforestation since 1990**, measured as verifiable changes in carbon stocks in each commitment period, **shall be used to meet the commitments** under this Article of each Party included in Annex I. **The greenhouse gas emissions by sources and removals by sinks associated with those activities shall be reported in a transparent and verifiable manner** and reviewed in accordance with Articles 7 and 8.

11

Kyoto Protocol

■ Parties; Annex I & II countries with binding targets

■ Parties; Developing countries without binding targets

■ States not Party to the Protocol

■ Signatory country with no intention to ratify the treaty, with no binding targets

■ Countries that have denounced the Protocol, with no binding targets

■ Parties with no binding targets in the second period, which previously had targets

14

Kyoto Mechanisms

- Joint Implementation
 - Allows developed countries to implement projects that reduce emissions or increase natural GHG sinks in other *developed countries*; such projects can be counted towards the emission reductions of the investing country
- Clean Development Mechanism
 - Allows developed countries to implement projects that reduce emissions or increase natural GHG sinks in *developing countries*; such projects can be counted towards the emission reductions of the investing country
 - Australian Carbon Data Accounting Model
 - <http://www.climatechange.gov.au/en/government/initiatives/ncat.aspx>
 - being discussed as pilot for international metric for quantifying effects of reforestation on the carbon fluxes
- Emissions Trading
 - Annex I countries can purchase emission units from other *Annex I countries* that find it easier to reduce their own emissions

Kyoto Emission Penalties

What happens if a country fails to reach its Kyoto emissions target?

The Kyoto Protocol contains measures to assess performance and progress. It also contains some penalties. Countries that fail to meet their emissions targets by the end of the first commitment period (2012) must make up the difference plus a penalty of 30 per cent in the second commitment period

Their ability to sell credits under emissions trading will also be suspended

<http://www.cbc.ca/news/background/kyoto/>

Kyoto Gases

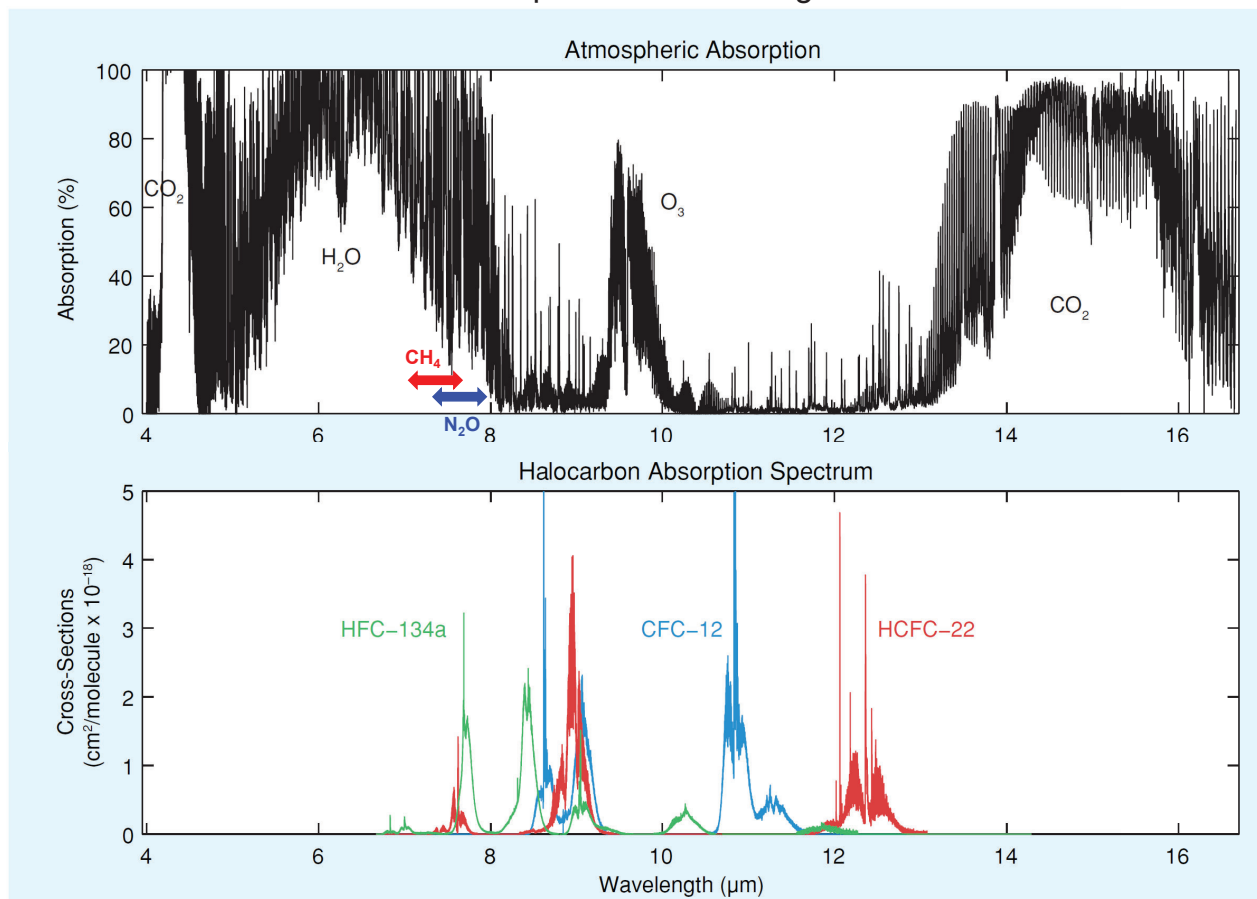

GHG	GWP, 100-yr	Industrial Use	Lifetime
CO ₂	1	Fossil fuel combustion; Land use changes	Multiple, ~172 yrs
CH ₄	25	Fossil fuel combustion; Rice paddies; Animal waste; Sewage treatment and landfills; Biomass burning	~10 yrs
N ₂ O	298	Agriculture & river chemistry associated with pollution Biomass burning & fossil fuel combustion	~115 yrs
HFCs	124 to 15000	Refrigerant (HFC-143a: C ₂ H ₃ F ₃), foam blowing agent, and by product of HCFC manufacture	Range from 1.5 to 270 yrs
PFCs	7400 to 12200	Aluminum smelting (CF ₄) Semiconductor manufacturing (CF ₄)	1000 to 50,000 yrs
SF ₆	22800	Insulator in high voltage electrical equipment Magnesium casting Shoes and tennis balls (minor source)	3200 yrs

19

GWP – Global Warming Potential

$$\text{GWP (HFC-143a)} = \frac{\int_{\text{time initial}}^{\text{time final}} a_{\text{HFC-143a}} \times [\text{HFC-143a}(t)] dt}{\int_{\text{time initial}}^{\text{time final}} a_{\text{CO}_2} \times [\text{CO}_2(t)] dt}$$

where:

$a_{\text{HFC-143a}}$ = Radiative Efficiency ($\text{W m}^{-2} \text{ppb}^{-1}$) due to HFC-143a

a_{CO_2} = Radiative Efficiency ($\text{W m}^{-2} \text{ppb}^{-1}$) due to CO_2

HFC-143a (t) = time-dependent response to an instantaneous release of a pulse of HFC-143a

CO_2 (t) = time-dependent response to an instantaneous release of a pulse of CO_2

Note: HFC-143a is $\text{C}_2\text{H}_3\text{F}_3$
HCFC-22 is CH_3CClF_2

	τ (yr)	GWP Time Horizon		ODP
		20-yr	100-yr	
HFC-143a	51	7050	5080	0
HCFC-22	12	5310	1780	0.034
CFC-11	52	7090	5160	1.0

27

Two Super Heroes

US / China Announcement ⇒ Paris Climate Agreement

Nov 2014: Presidents Obama & Xi announced

U.S. would reduce GHG emissions to **27%** below 2005 **by 2025**

China would **peak** GHG emissions **by 2030** with best effort to peak early

Paris Climate Agreement:

Article 2, Section 1, Part a):

Objective to hold “increase in GMST to well below **2°C** above pre-industrial levels and to pursue efforts to limit the temperature increase to **1.5°C** above pre-industrial levels”

INDC: Intended **N**ationally **D**etermined **C**ontributions to reduce GHG emissions

- Submitted prior to Dec 2015 meeting in Paris
- Consist of either **unconditional** (promise) or **conditional** (contingent) pledges
- Generally extend from present to year 2030

Copyright © 2019 University of Maryland

This material may not be reproduced or redistributed, in whole or in part, without written permission from Ross Salawitch.

28

Paris Climate Agreement, Dec 2015:

- a) Negotiated as an “agreement” (unilateral pledges to reduce GHG emissions by member nations) rather than a treaty to avoid the need for Senate approval
<https://www.senate.gov/artandhistory/history/common/briefing/Treaties.htm>
- b) Based on language of ratification, U.S. committed to agreement until 4 November 2020
<https://qz.com/996882/paris-climate-agreement-trumps-renegotiation-is-not-realistic-in-any-way>
<https://www.theatlantic.com/science/archive/2017/08/trump-and-the-paris-agreement-what-just-happened/536040>

Summer 2017:

- President Trump states US intends to withdraw from Paris Climate Agreement
- “withdrawal” symbolic in that US is committed to the agreement until 4 Nov 2020

August 2018:

- Obama’s plan for achieving the U.S. NDC had relied on implementation of the Clean Power Plan by the EPA
- Main gist of Clean Power Plan was transitioning power plants from coal to either natural gas or renewables
- Combustion of natural gas produces about 70% more energy per CO₂ released to the atmosphere than coal
- Clean power plan being abandoned by the US EPA
<https://psmag.com/environment/the-epa-publishes-its-proposed-replacement-for-the-clean-power-plan>
but the main reason natural gas has replaced coal for US power generation is economic, rather than regulatory

What will occur on 3 Nov 2020 ???

Pacala and Socolow: CO₂ Stabilization Wedges

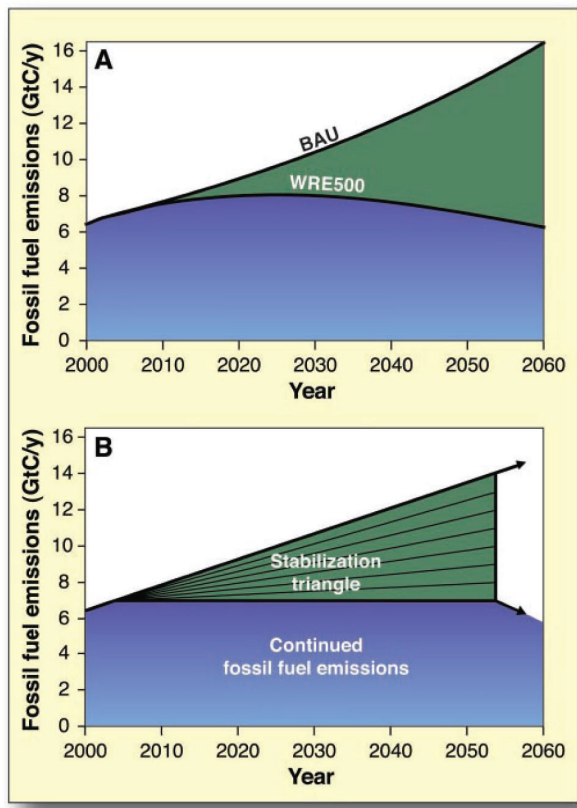

Fig. 1. (A) The top curve is a representative BAU emissions path for global carbon emissions as CO₂ from fossil fuel combustion and cement manufacture: 1.5% per year growth starting from 7.0 GtC/year in 2004. The bottom curve is a CO₂ emissions path consistent with atmospheric CO₂ stabilization at 500 ppm by 2125 akin to the Wigley, Richels, and Edmonds (WRE) family of stabilization curves described in (11), modified as described in Section 1 of the SOM text. The bottom curve assumes an ocean uptake calculated with the High-Latitude Exchange Interior Diffusion Advection (HILDA) ocean model (12) and a constant net land uptake of 0.5 GtC/year (Section 1 of the SOM text). The area between the two curves represents the avoided carbon emissions required for stabilization. **(B)** Idealization of (A): A stabilization triangle of avoided emissions (green) and allowed emissions (blue). The allowed emissions are fixed at 7 GtC/year beginning in 2004. The stabilization triangle is divided into seven wedges, each of which reaches 1 GtC/year in 2054. With linear growth, the total avoided emissions per wedge is 25 GtC, and the total area of the stabilization triangle is 175 GtC. The arrow at the bottom right of the stabilization triangle points downward to emphasize that fossil fuel emissions must decline substantially below 7 GtC/year after 2054 to achieve stabilization at 500 ppm.

50

Pacala and Socolow: CO₂ Stabilization Wedges

Action	Details
Economy-wide carbon-intensity reduction (emissions/\$GDP)	<i>Energy efficiency and conservation</i> Increase reduction by additional 0.15% per year (e.g., increase U.S. goal of 1.96% reduction per year to 2.11% per year)
1. Efficient vehicles	Increase fuel economy for 2 billion cars from 30 to 60 mpg
2. Reduced use of vehicles	Decrease car travel for 2 billion 30-mpg cars from 10,000 to 5000 miles per year
3. Efficient buildings	Cut carbon emissions by one-fourth in buildings and appliances projected for 2054
4. Efficient baseload coal plants	Produce twice today's coal power output at 60% instead of 40% efficiency (compared with 32% today)
5. Gas baseload power for coal baseload power	<i>Fuel shift</i> Replace 1400 GW 50%-efficient coal plants with gas plants (four times the current production of gas-based power)
6. Capture CO ₂ at baseload power plant	<i>CO₂ Capture and Storage (CCS)</i> Introduce CCS at 800 GW coal or 1600 GW natural gas (compared with 1060 GW coal in 1999)
7. Capture CO ₂ at H ₂ plant	Introduce CCS at plants producing 250 MtH ₂ /year from coal or 500 MtH ₂ /year from natural gas (compared with 40 MtH ₂ /year today from all sources)
8. Capture CO ₂ at coal-to-synfuels plant	Introduce CCS at synfuels plants producing 30 million barrels a day from coal (200 times Sasol), if half of feedstock carbon is available for capture
Geological storage	Create 3500 Sleipners

51

Pacala and Socolow: CO₂ Stabilization Wedges

Action	Details
9. Nuclear power for coal power	<i>Nuclear fission</i> Add 700 GW (twice the current capacity)
10. Wind power for coal power	<i>Renewable electricity and fuels</i> Add 2 million 1-MW-peak windmills (50 times the current capacity) "occupying" 30×10^6 ha, on land or offshore
11. PV power for coal power	Add 2000 GW-peak PV (700 times the current capacity) on 2×10^6 ha
12. Wind H ₂ in fuel-cell car for gasoline in hybrid car	Add 4 million 1-MW-peak windmills (100 times the current capacity)
13. Biomass fuel for fossil fuel	Add 100 times the current Brazil or U.S. ethanol production, with the use of 250×10^6 ha (one-sixth of world cropland)
14. Reduced deforestation, plus reforestation, afforestation, and new plantations.	<i>Forests and agricultural soils</i> Decrease tropical deforestation to zero instead of 0.5 GtC/year, and establish 300 Mha of new tree plantations (twice the current rate)
15. Conservation tillage	Apply to all cropland (10 times the current usage)
