

Kyoto Protocol, Paris Climate Agreement, Fossil Fuel Reserves, World Energy Needs, and The Need for Renewable Energy

AOSC / CHEM 433 & AOSC / CHEM 633

Ross Salawitch

Class Web Sites:

<http://www2.atmos.umd.edu/~rjs/class/spr2022>

<https://myelms.umd.edu/courses/137772>

Topics for today:

- Kyoto Protocol
- Paris Climate Agreement
- Fossil Fuel Reserves
- World Energy Needs
- Need for Renewable Energy, Sooner Rather Than Later !

Lay the ground work for rest of the semester

Lecture 18

19 April 2022

AT 18

Q1. According to Chemistry in Context, what was the goal of the Kyoto Protocol?

Binding emission reduction targets for six greenhouse gases (CO_2 , CH_4 , N_2O , HFCs, PFCs, and SF_6), relative to 1990 emission levels, among 38 developed nations.

Good job!

Binding emission reduction of CO_2 , the most important anthropogenic GHG, relative to 1990 emission levels, among 38 developed nations.

The Kyoto Protocol considers CH_4 , N_2O , HFCs, PFCs, and SF_6 , in addition to CO_2 .

Binding emission reduction targets for six greenhouse gases (CO_2 , CH_4 , N_2O , HFCs, PFCs, and SF_6), relative to 1990 emission levels, among nearly all of the nations of the world.

The Kyoto Protocol had GHG reduction targets for only 38 nations.

Binding emission reduction of CO_2 , the most important anthropogenic GHG, relative to 1990 emission levels, among nearly all of the nations of the world.

The Kyoto Protocol considers CH_4 , N_2O , HFCs, PFCs, and SF_6 , in addition to CO_2 and the Kyoto Protocol had GHG reduction targets for only 38 nations.

Kyoto Protocol

- Negotiated in Kyoto, Japan in November 1997
 - Annex I countries: Developed countries (Table 10.1 of Houghton) with varying emission targets, 2008-2012 relative to 1990, ranging from +10% (Iceland) to –8% (EU-15)

Table 10.1 *Emissions targets (1990*–2008/2012) for greenhouse gases under the Kyoto Protocol*

Country	Target (%)
EU-15**, Bulgaria, Czech Republic, Estonia, Latvia, Lithuania, Romania, Slovakia, Slovenia, Switzerland	–8
USA***	–7
Canada, Hungary, Japan, Poland	–6
Croatia	–5
New Zealand, Russian Federation, Ukraine	0
Norway	+1
Australia	+8
Iceland	+10

* Some economies in transition (EIT) countries have a baseline other than 1990.

** The fifteen countries of the European Union have agreed an average reduction; changes for individual countries vary from –28% for Luxembourg, –21% for Denmark and Germany to +25% for Greece and +27% for Portugal.

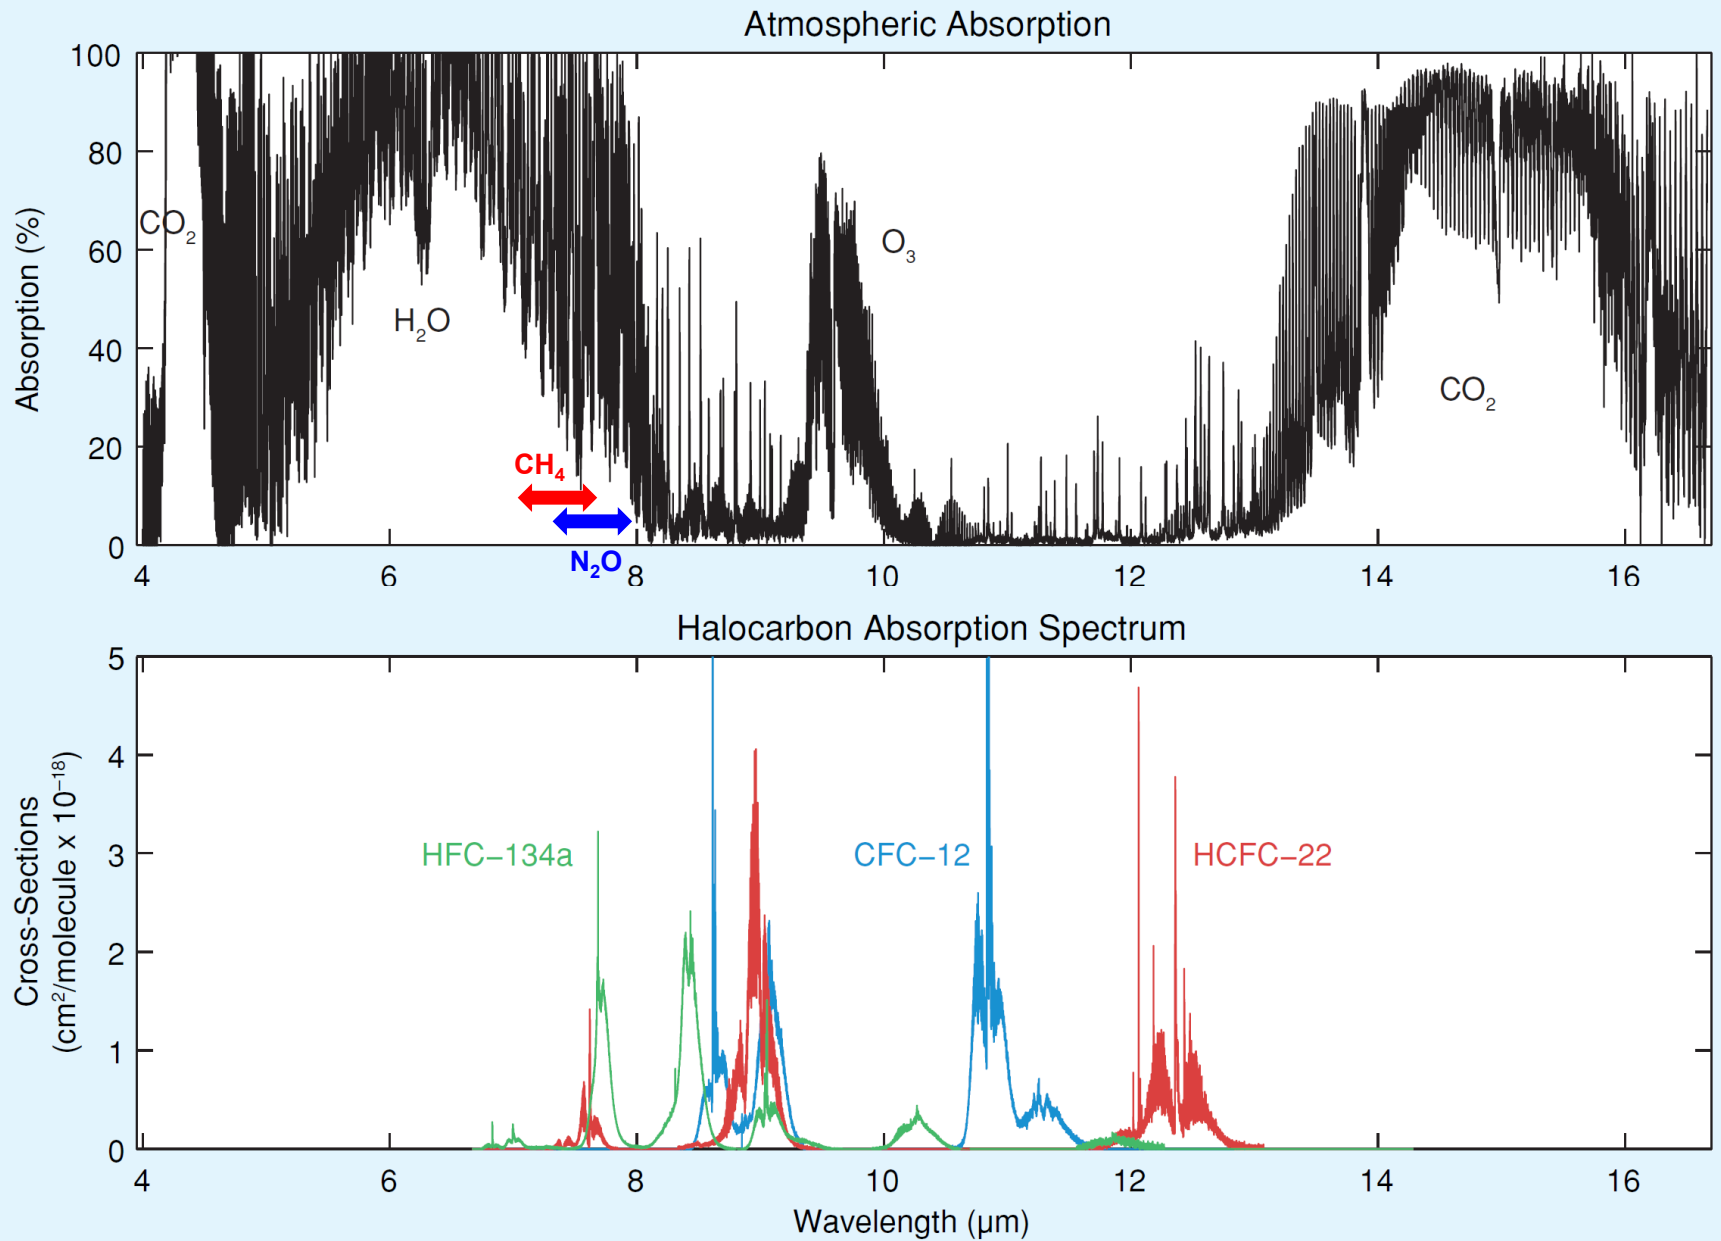

*** The USA has stated that it will not ratify the Protocol.

Houghton, *Global Warming: The Complete Briefing*, 3d Edition, 2004

Kyoto Gases

GHG	GWP, 100-yr	Industrial Use	Lifetime
CO ₂	1	Fossil fuel combustion; Land use changes	Multiple
CH ₄	28	Fossil fuel combustion; Rice paddies; Animal waste; Sewage treatment and landfills; Biomass burning	12.4 yrs
N ₂ O	265	Agriculture & river chemistry associated with pollution Biomass burning & fossil fuel combustion	121 yrs
HFCs	116 to 12,400	Refrigerant (HFC–143a: C ₂ H ₃ F ₃), foam blowing agent, and by product of HCFC manufacture	Range from 1.3 to 242 yrs
PFCs	6290 to 11,100	Aluminum smelting (CF ₄) Semiconductor manufacturing (CF ₄)	2000 to 50,000 yrs
SF ₆	23,500	Insulator in high voltage electrical equipment Magnesium casting Shoes and tennis balls (minor source)	3200 yrs

Absorption vs. Wavelength

GWP – Global Warming Potential

$$\text{GWP (HFC-143a)} = \frac{\int_{\text{time initial}}^{\text{time final}} a_{\text{HFC-143a}} \times [\text{HFC-143a}(t)] dt}{\int_{\text{time initial}}^{\text{time final}} a_{\text{CO}_2} \times [\text{CO}_2(t)] dt}$$

where:

$a_{\text{HFC-143a}}$ = Radiative Efficiency ($\text{W m}^{-2} \text{ ppb}^{-1}$) due to HFC-143a

a_{CO_2} = Radiative Efficiency ($\text{W m}^{-2} \text{ ppb}^{-1}$) due to CO_2

HFC-143a (t) = time-dependent response to an instantaneous release of a pulse of HFC-143a

$\text{CO}_2(t)$ = time-dependent response to an instantaneous release of a pulse of CO_2

Note: HFC-143a is $\text{C}_2\text{H}_3\text{F}_3$
HCFC-22 is CH_3CClF_2

		GWP Time Horizon		ODP
		20-yr	100-yr	
	τ (yr)			n.a.
HFC-143a	51	7050	5080	0
HCFC-22	12	5310	1780	0.034
CFC-11	52	7090	5160	1.0

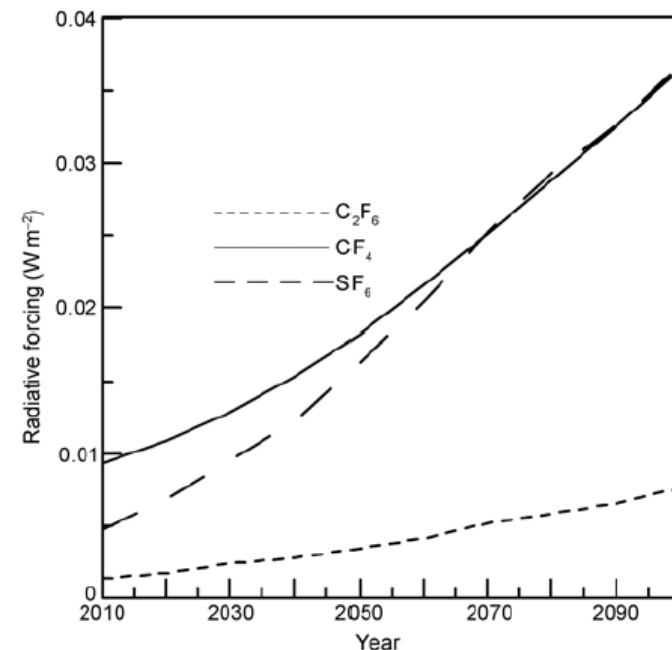

Figure 4 Radiative forcing of C_2F_6 , CF_4 , and SF_6 from 2010 to 2100.

Zhang et al., Sci China Earth Sci, 2011

PFC: Perfluorocarbons

- Contain only C & F
- Strong bonds: chemically stable
 $\tau_{\text{CF}_4} = 50,000 \text{ yr} !$
- Applications: medical, electrical, cosmetics

Radiative Forcing due to SF₆

https://www.esrl.noaa.gov/gmd/webdata/hats/combined/hats_sf6_zones.png

Zhang et al., Sci China
Earth Sci, 2011

SF₆: Sulfur hexafluoride

- $\tau_{\text{SF}_6} = 3,200 \text{ yr}$
- Applications: gaseous dielectric in electrical transformers; insulator for windows; retina surgery
- Also had been used in sneakers but Nike has phased out this use:

<https://www.bloomberg.com/news/articles/2006-09-24/nike-goes-for-the-green>

UNFCCC Basket of Gases

GHG	GWP, 100-yr	Industrial Use	Lifetime
CO ₂	1	Fossil fuel combustion; Land use changes	Multiple
CH ₄	28	Fossil fuel combustion; Rice paddies; Animal waste; Sewage treatment and landfills; Biomass burning	12.4 yrs
N ₂ O	265	Agriculture & river chemistry associated with pollution Biomass burning & fossil fuel combustion	121 yrs

Why doesn't tropospheric ozone appear?

Why not CFCs and HCFCs ?

AT 18

Q2. According to Chemistry in Context:

- a) when did the Kyoto Protocol go into effect?
- b) what country's ratification triggered the Kyoto Protocol going into effect?
- c) what country had never opted to participate, and why did this county opt to not participate?

a) 2005

b) The Russian Federation

☐ c) The United States, due to the fear of serious harm to the U.S. economy

Excellent

a) 1997

b) The United States

☐ c) China, due to the fear of serious harm to the Chinese economy

Please review material on page 145 of Chemistry in Context.

Kyoto Protocol

- Negotiated in Kyoto, Japan in November 1997
 - Annex I countries: Developed countries (Table 3.1 of *Paris: Beacon of Hope*) with varying emission targets, 2008-2012 relative to 1990, ranging from +10% (Iceland) to –8% (EU-15)
 - Annex II countries: sub-group of Annex I countries that agree to pay cost of technology for emission reductions in developing countries
Australia, Austria, Belgium, Canada, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Japan, Luxembourg, Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, United Kingdom, United States of America
 - Developing countries: all countries besides those in Table 3.1 of *Paris: Beacon of Hope*
 - Went into effect in 16 February 2005 after signed by Russia
- Annex I countries:
 - agree to reduce GHG emissions to target tied to 1990 emissions. If they cannot do so, they must buy emission credits or invest in conservation
- Developing countries:
 - no restrictions on GHG emissions
 - encouraged to use new technology, funded by Annex II countries, to reduce emissions
 - can not sell emission credits

Kyoto Protocol

<https://www.climate-change-guide.com/kyoto-protocol.html>

Kyoto Protocol Targets

CO₂ emissions

Does not include:

- LULUCF (land use, land-use change and forestry)
- GHGs other than CO₂

Kyoto target (2008 to 2012) for emissions of CO₂, relative to **1990 emissions**
selected locations

Australia	108%
EU15	92%
Iceland	110%
Japan	94%
New Zealand	100%
Norway	101%
Russia	100%
US	93%

The Collapse of the Kyoto Protocol and the Struggle to Slow Global Warming
David G. Victor, Princeton University Press, 2001.

Kyoto Protocol Targets

CO₂ emissions

Does not include:

- LULUCF (land use, land-use change and forestry)
- GHGs other than CO₂

AT 18

Q3: According to *Chemistry in Context*, based on the values of energy difference for combustion of one gram of natural gas and combustion of one gram of coal (assumed for sake of argument to be pure carbon) how much more efficient is the generation of electricity by the combustion of natural gas (CH_4) compared to generation of electricity by the combustion of coal? You may assume the heat released by the two combustion processes can be converted into electricity at the same efficiency.

Correct Answer

☐

Since $50.1 \text{ kJ/g} / 32.8 \text{ kJ/g} = 1.5$, about 50% more electricity can be produced via the combustion of natural gas than can be produced by the combustion of coal.

Indeed; will delve into more nuance of this relation during class.

☐

Since $50.1 \text{ kJ/g} / 14.2 \text{ kJ/g} = 3.5$, about 3 times more electricity can be produced via the combustion of natural gas than can be produced by the combustion of coal.

The value of 14.2 kJ/g is for oxidation of glucose, rather than combustion of coal.

☐

Since $32.8 \text{ kJ/g} / 14.2 \text{ kJ/g} = 2.3$, about twice as much electricity can be produced via the combustion of natural gas than can be produced by the combustion of coal.

The value of 14.2 kJ/g is for oxidation of glucose, rather than combustion of coal.

☐

Since $44.4 \text{ kJ/g} / 28.9 \text{ kJ/g} = 1.5$, about 50% more electricity can be produced via the combustion of natural gas than can be produced by the combustion of coal.

The 50% part is correct.

However, 44.4 kJ/g is for octane (here, should use 50.1 kJ/g for natural gas) and the 28.9 kJ/g is for ethanol (here, should use 32.8 kJ/g for coal).

AT 18

Combustion of 1 gram of CH_4 results of 50.1 kJ of energy

Combustion of 1 gram of C results in 32.8 kJ of energy

Therefore, we might conclude natural gas is $50.1 / 32.8 = 1.53$ times more efficient, which I would write as 53% (i.e., about 50%) more efficient.

However, combustion of 1 gram of C results in $44/12 = 3.667$ gram of CO_2
whereas combustion of 1 gram of CH_4 results in $44/16 = 2.75$ gram of CO_2

To place natural gas and coal (pure C) on equal footing, must first multiply energy yield from natural gas by $(3.667/2.75) = 1.33$, so that atmospheric CO_2 produced by both processes is identical.

We find natural gas is $1.33 \times 1.53 = 2.0$; i.e., natural gas is about 100% more efficient than coal.

Copyright © The McGraw-Hill Companies, Inc. Permission required for reproduction or display.

Fig 4.26. Energy differences (in kJ/g) for the combustion of methane (CH_4), n-octane (C_8H_{18}), coal (assumed to be pure carbon), ethanol ($\text{C}_2\text{H}_5\text{OH}$), and wood (assumed to be glucose).

AT 18

Combustion of 1 gram of CH_4 results of 50.1 kJ of energy

Combustion of 1 gram of C results in 32.8 kJ of energy

Alas, coal is not pure carbon in the real world. Rather, notational formula for coal is $\text{C}_{135}\text{H}_{96}\text{O}_9\text{NS}$ (page 162 of *Chemistry in Context*): i.e., coal has a carbon content of 85% by mass.

Therefore, an even better estimate where the ratio of C to H in coal and natural gas is treated in the same manner, we would write:

Natural gas is $(1.33 \times 1.53) / 0.85 = 1.73$; i.e., natural gas is about 70% more efficient than coal, in terms of energy yield per mole of CO_2 .

Fig 4.26. Energy differences (in kJ/g) for the combustion of methane (CH_4), n-octane (C_8H_{18}), coal (assumed to be pure carbon), ethanol ($\text{C}_2\text{H}_5\text{OH}$), and wood (assumed to be glucose).

Future Use of Fossil Fuels

Table that is commonly used:

Fossil Fuel	GHG Output (pounds CO ₂ per kWh)
Oil Sands	5.6
Coal	2.1
Oil	1.9
Gas	1.3

Natural gas produces $(1/1.3) / (1/2.1) = 1.6$; i.e., **61% more energy than coal**, per CO₂ released

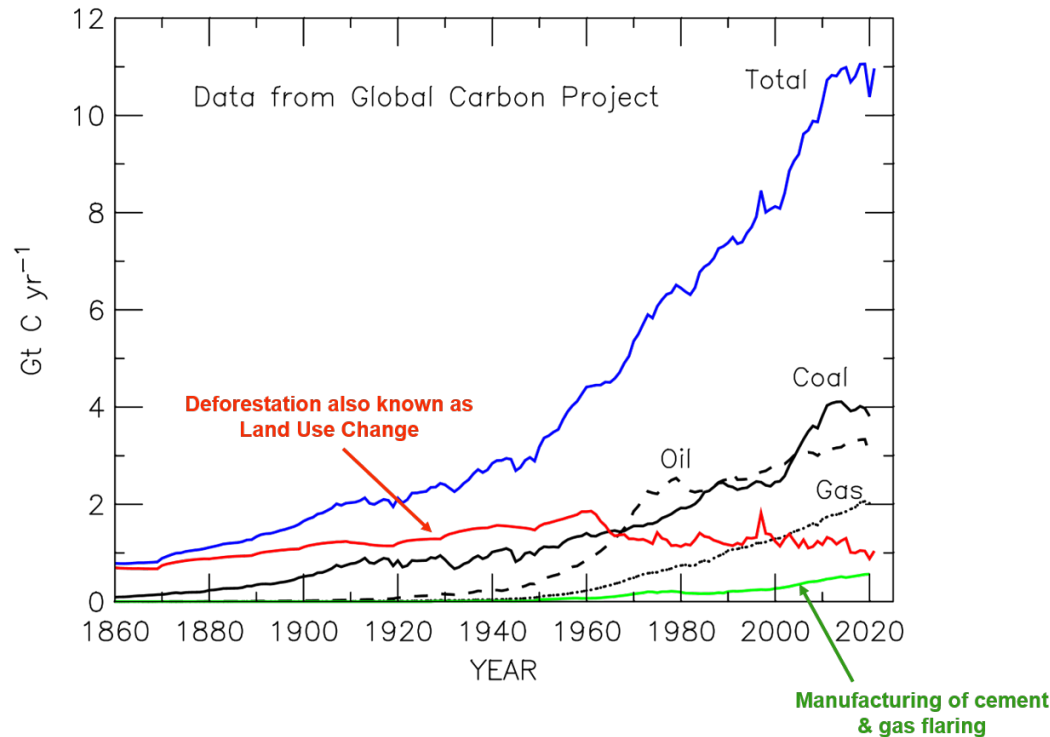

Natural gas produces $(1/1.3) / (1/5.6) = 4.3$; i.e., **more than 4× more energy than oil sands**, per CO₂ released

Natural Gas In The News

German employers and unions jointly oppose boycott of Russian natural gas

World Apr 18, 2022 3:13 PM EDT

BERLIN (AP) — Germany's employers and unions have joined together in opposing an immediate European Union ban on natural gas imports from Russia **over its invasion of Ukraine**, saying such a move would lead to factory shutdowns and the loss of jobs in the bloc's largest economy.

"A rapid gas embargo would lead to loss of production, shutdowns, a further de-industrialization and the long-term loss of work positions in Germany," said Rainer Dulger, chairman of the BDA employer's group, and Reiner Hoffmann, chairman of the DGB trade union confederation, in a joint statement Monday on Germany's dpa news agency.

The statement comes as European leaders are discussing possible new energy sanctions against Russian oil, following a decision April 7 to ban Russian coal imports beginning in August. Ukraine's leaders say revenues from Russia's energy exports are financing Moscow's destructive war on Ukraine and must be ended.

That won't be easy to do. The EU's 27 nations get around 40 percent of their natural gas from Russia and around 25 percent of their oil. Natural gas would be the most difficult to do without, energy analysts say, since most of it comes by pipeline from Russia and supplies of liquefied gas, which can be ordered by ship, are limited amid strong demand worldwide.

Two Super Heroes

US / China Announcement \Rightarrow Paris Climate Agreement

Nov 2014: Presidents Obama & Xi announced

U.S. would reduce GHG emissions to 27% below 2005 by 2025

China would peak GHG emissions by 2030 with best effort to peak early

Paris Climate Agreement:

Article 2, Section 1, Part a):

Objective to hold “increase in GMST to well below **2°C** above pre-industrial levels and to pursue efforts to limit the temperature increase to **1.5°C** above pre-industrial levels”

INDC: Intended **N**ationally **D**etermined **C**ontributions to reduce GHG emissions

- Submitted prior to Dec 2015 meeting in Paris
- Consist of either unconditional (promise) or conditional (contingent) pledges
- Generally extend from present to year 2030

Paris Climate Agreement, Dec 2015:

- a) Negotiated as an “agreement” (unilateral pledges to reduce GHG emissions by member nations) rather than a treaty to avoid the need for Senate approval

<https://www.senate.gov/artandhistory/history/common/briefing/Treaties.htm>

- b) Based on language of ratification, U.S. committed to agreement until 4 November 2020

<https://qz.com/996882/paris-climate-agreement-trumps-renegotiation-is-not-realistic-in-any-way>

<https://www.theatlantic.com/science/archive/2017/08/trump-and-the-paris-agreement-what-just-happened/536040>

Summer 2017:

President Trump states US intends to withdraw from Paris Climate Agreement

- “withdrawal” symbolic in that US is committed to the agreement until 4 Nov 2020

August 2018:

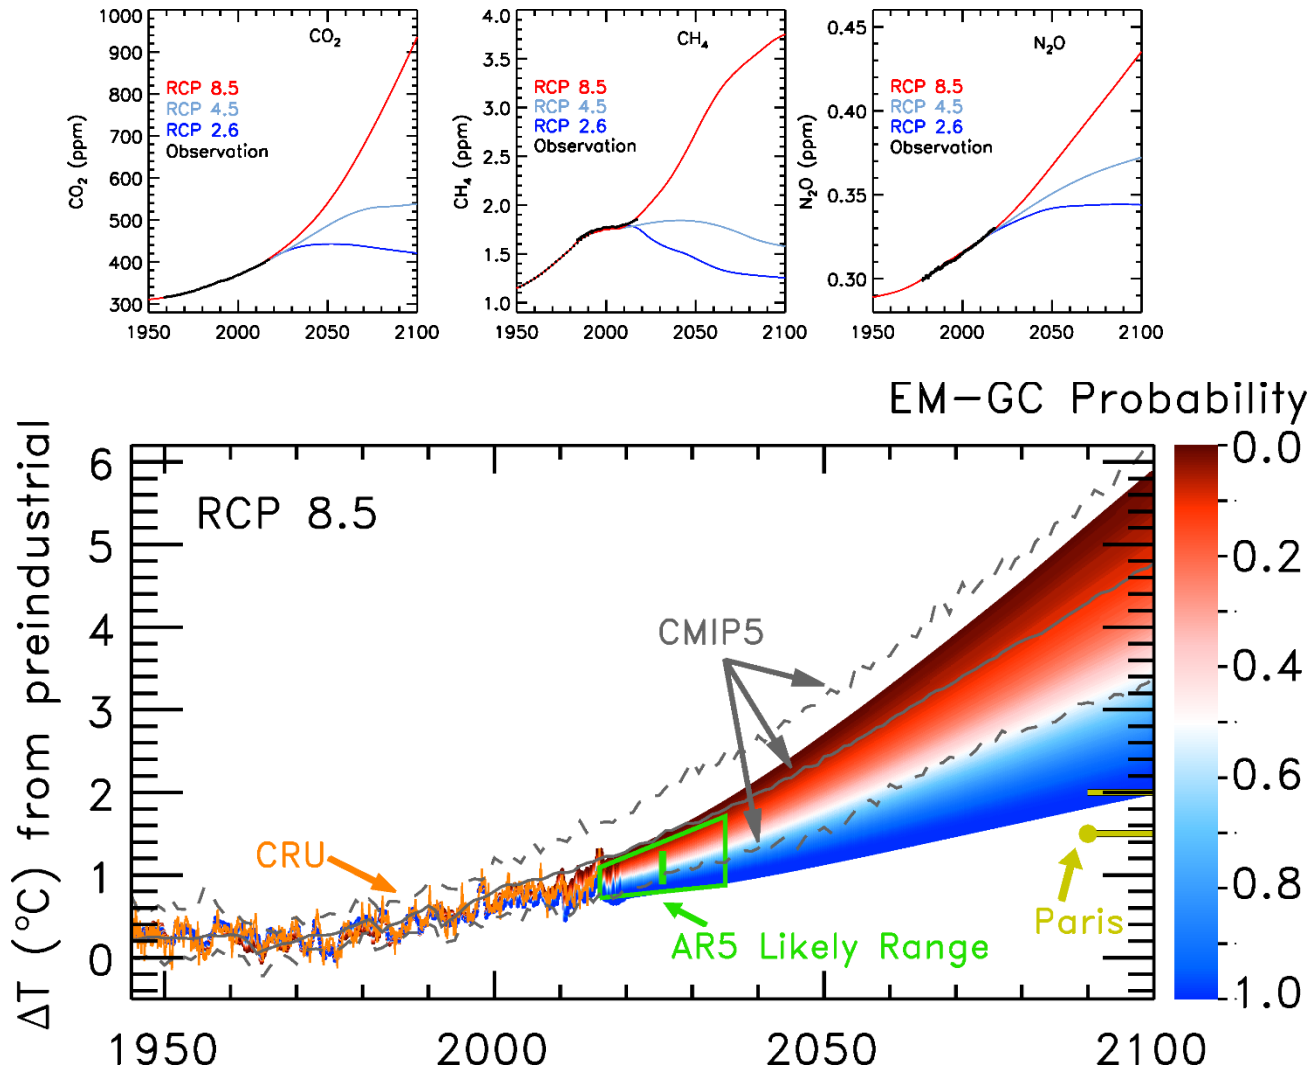

- Obama’s plan for achieving the U.S. NDC had relied on implementation of the Clean Power Plan by the EPA
- Main gist of Clean Power Plan was transitioning power plants from coal to either natural gas or renewables
- Combustion of natural gas produces about 70% more energy per CO₂ released to the atmosphere than coal
- Clean power plan being abandoned by the US EPA

<https://psmag.com/environment/the-epa-publishes-its-proposed-replacement-for-the-clean-power-plan>

but the main reason natural gas has replaced coal for US power generation is economic, rather than regulatory

What occurred on 3 Nov 2020 ?!?

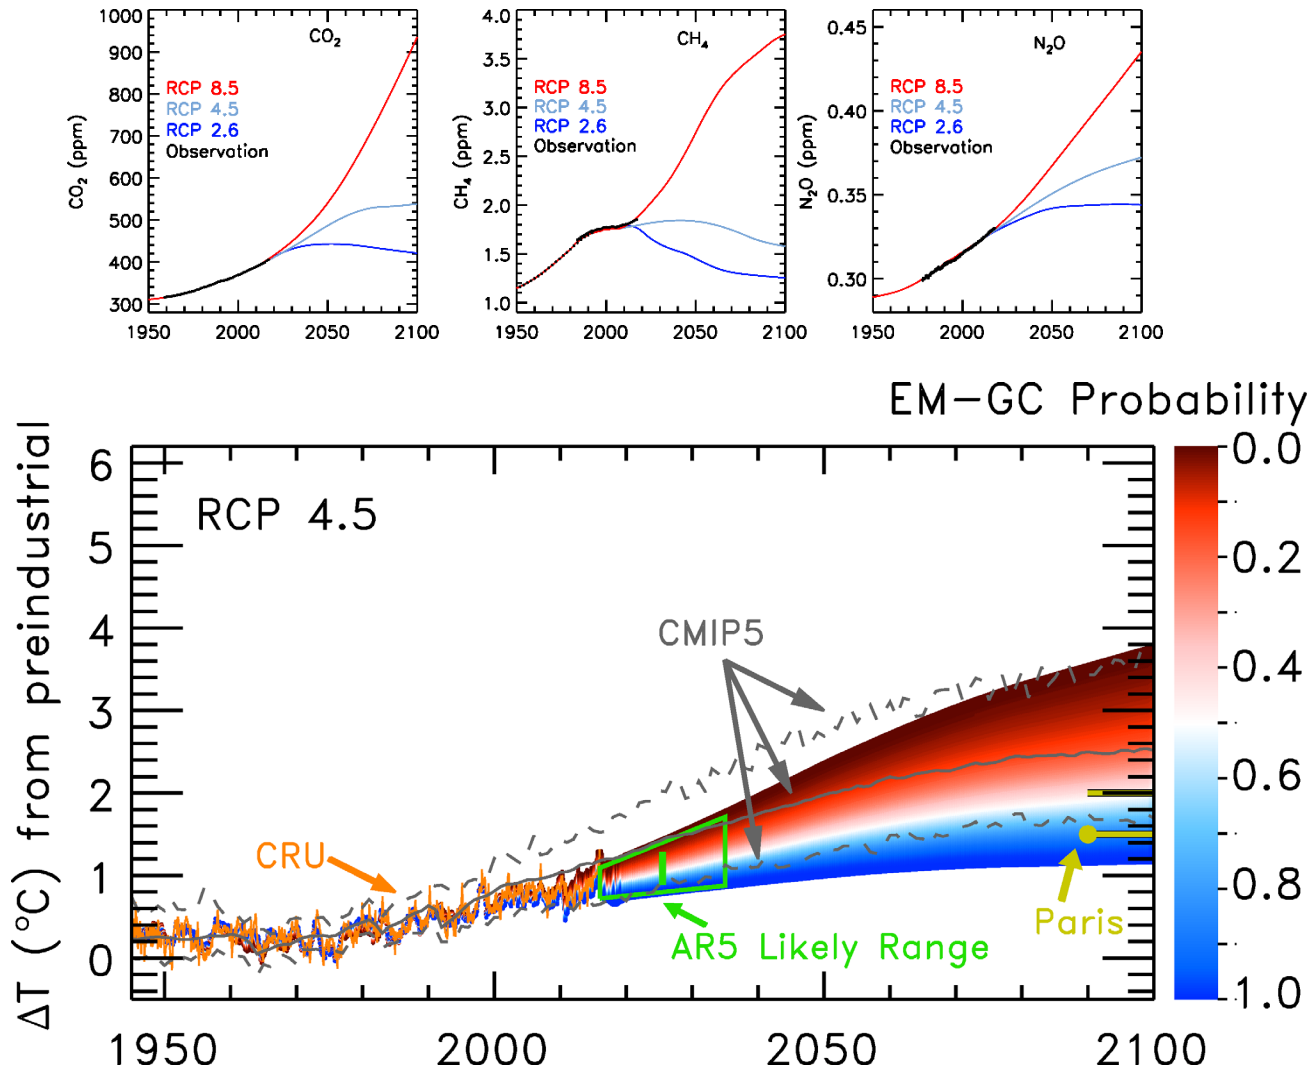

EM-GC Forecast vs CMIP5

If GHGs follow RCP 8.5, **0% chance** rise GMST stays below **1.5°C** and **0% chance** stays below **2.0°C**

Austin Hope, private communication, 2020.

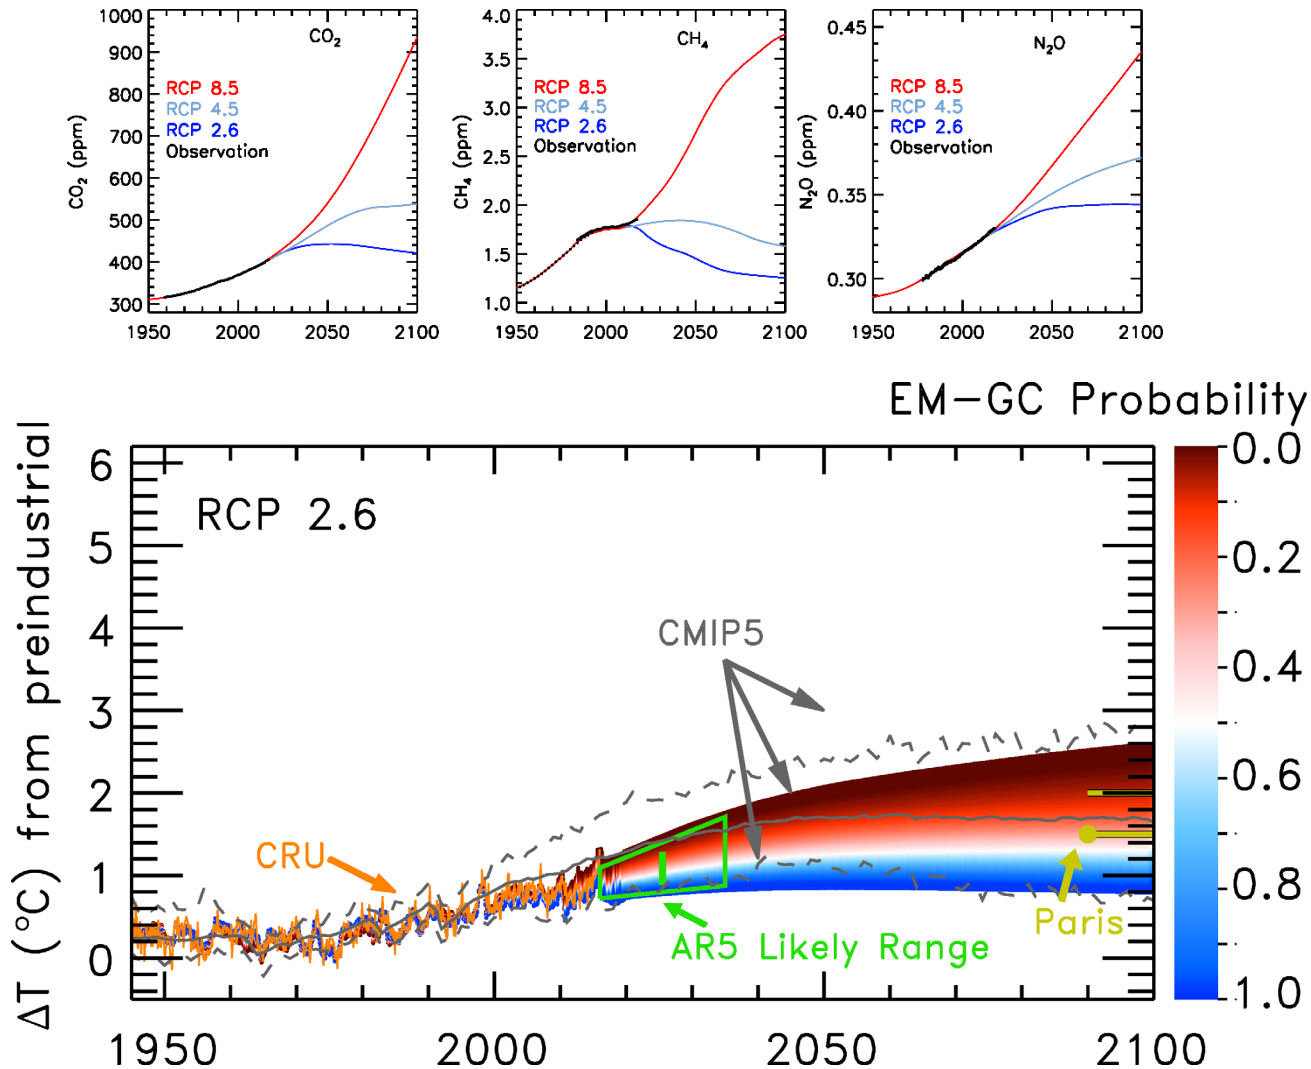

EM-GC Forecast vs CMIP5

If GHGs follow RCP 4.5, **10%** chance rise GMST stays below **1.5°C** and **50%** chance stays below **2.0°C**

Austin Hope, private communication, 2020.

EM-GC Forecast vs CMIP5

If GHGs follow RCP 2.6, **67%** chance rise GMST stays below **1.5°C** and **92%** chance stays below **2.0°C**

Austin Hope, private communication, 2020.

World Energy Consumption and CO₂ Emissions by Source

Business As Usual (i.e., projection of current trajectory) places the world in between RCP 4.5 and RCP 8.5 trajectories for global emission of CO₂

Fig 4.2
Paris Climate
Agreement:
Beacon of Hope

World Energy Consumption and CO₂ Emissions, Modified to Meet RCP 4.5 in 2030

Achieving RCP 4.5 requires half of total global energy to be supplied by sources that do not emit GHGs by year 2060

Fig 4.3
Paris Climate Agreement: Beacon of Hope

World Energy Consumption and CO₂ Emissions, Modified to Meet RCP 2.6 in 2030

Fig 4.5
 Paris Climate
 Agreement:
 Beacon of Hope

Achieving RCP 2.6 requires half of total global energy to be supplied by renewables/nuclear by 2060 coupled with massive Carbon Capture and Sequestration (CCS)

Conditional: GHG reductions contingent on financial and/or technology transfer

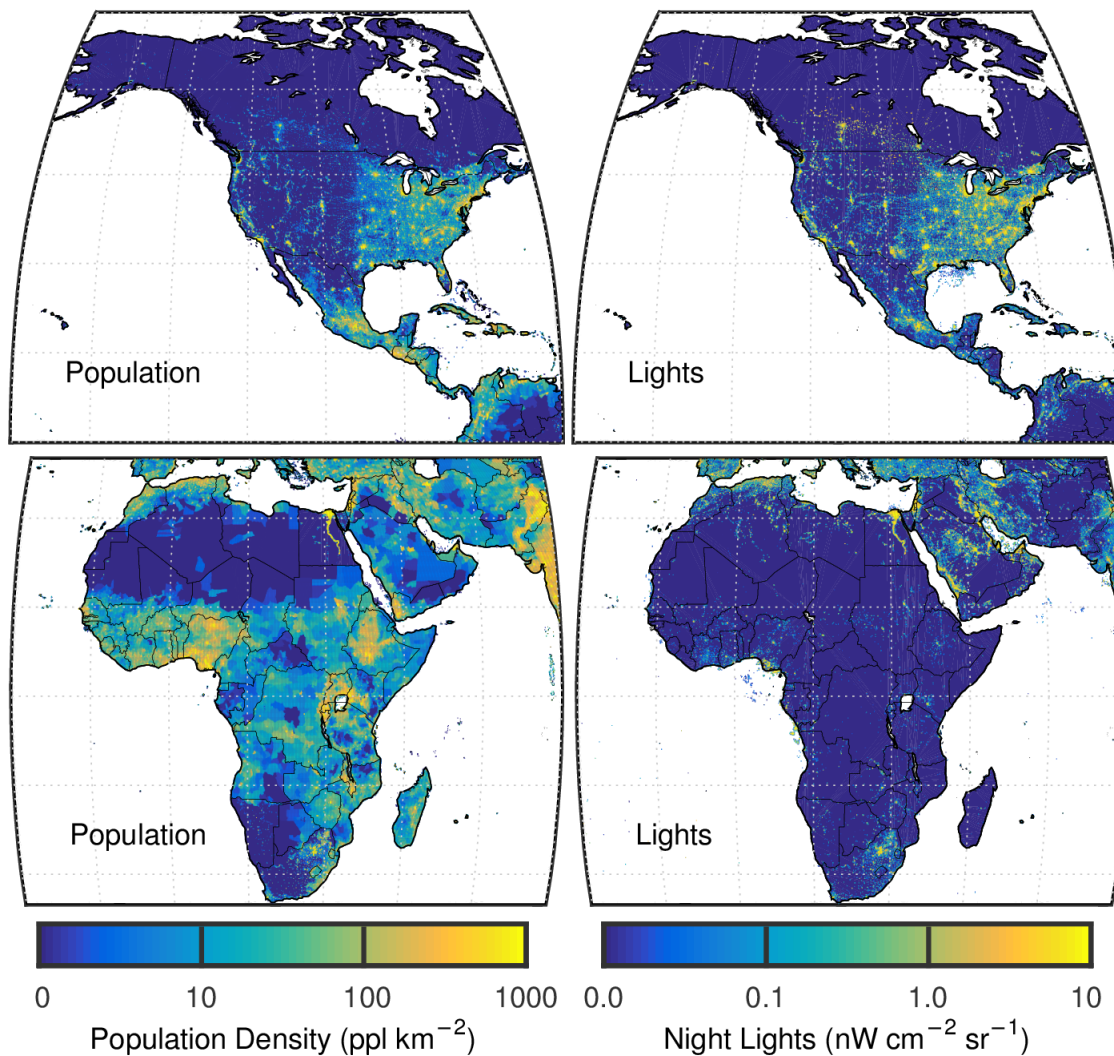

Fig 4.7
Paris Climate Agreement:
Beacon of Hope

Limiting global warming to 2°C will require a massive transition to renewables and/or implementation of carbon capture and sequestration in the developed world and initial electrification of developing world by renewables (i.e., must bypass fossil fuels)

This is a 150 km radius around Baltimore, United States. Approximately 17.4 million people live within this circle.

In this country, 100% of people had access to electricity in 2018.

This is a 150 km radius around Ruyigi, Burundi. Approximately 17.3 million people live within this circle.

In this country, 11% of people had access to electricity in 2018.

This is a 150 km radius around Beijing, China. Approximately 61.2 million people live within this circle.

In this country, 100% of people had access to electricity in 2018.

This is a 150 km radius around Rangpur, Bangladesh. Approximately 59.5 million people live within this circle.

In this country, 85% of people had access to electricity in 2018.

<https://datatopics.worldbank.org/sdgatlas/goal-7-affordable-and-clean-energy>

Limiting global warming to 2°C will require a massive transition to renewables and/or implementation of carbon capture and sequestration in the developed world and initial electrification of developing world by renewables (i.e., must bypass fossil fuels)

Energy Consumption By Sector, U.S.

In U.S., electric power industry uses largest share of energy

Energy consumption by sector, 2018

https://www.pewresearch.org/fact-tank/2020/01/15/renewable-energy-is-growing-fast-in-the-u-s-but-fossil-fuels-still-dominate/ft_2020-01-15_energyprimer_3/

Energy and Power

Simple equation connects energy and power

$$\text{Energy} = \text{Power} \times \text{Time}$$

Size of a **power** plant is commonly measured in units of power:

kW (kilo: 10^3 Watts): Home solar

MW (mega: 10^6 Watts) Industrial

GW (giga: 10^9 Watts): Massive Hydroelectric

TW (terra: 10^{12} Watts): Large Nation and/or Global

Output of a **power** plant in units of energy:

kWh (kilo: 10^3 W hour)

MWh (mega: 10^6 W hour)

GWh (gig: 10^9 W hour)

Capacity Factor: actual output of a power plant (energy) divided
by maximum output, if power plant could run
24/7/365 **at full capacity**

Please see https://energyeducation.ca/encyclopedia/Energy_vs_power
for a nice explanation of Energy & Power

Capacity factors of selected utility scale electricity generating technologies (2015)

capacity factor (output as a percent of full capacity)

Source: EIA

<https://marketrealist.com/2016/06/energy-sources-capacity-factor-capacity-additions>

World Installed ***Electricity*** Generating ***Capacity***: Power (Energy/Time)

Total Source	GW (year 2010)
Coal	1594
Natural Gas	1360
Hydro-electric	884
Solar	39
