

Global Winds AOSC 200

Tim Canty

Class Web Site: <http://www.atmos.umd.edu/~tcanty/aosc200>

Topics for today:

Global Wind Patterns

Deserts

Jet Stream

Monsoons

Ocean transport

Ocean cycles

Lecture 18

Oct 29 2019

Global Temperatures

What region of the planet is warmest?

Fig 9.1b *Weather: A Concise Introduction*

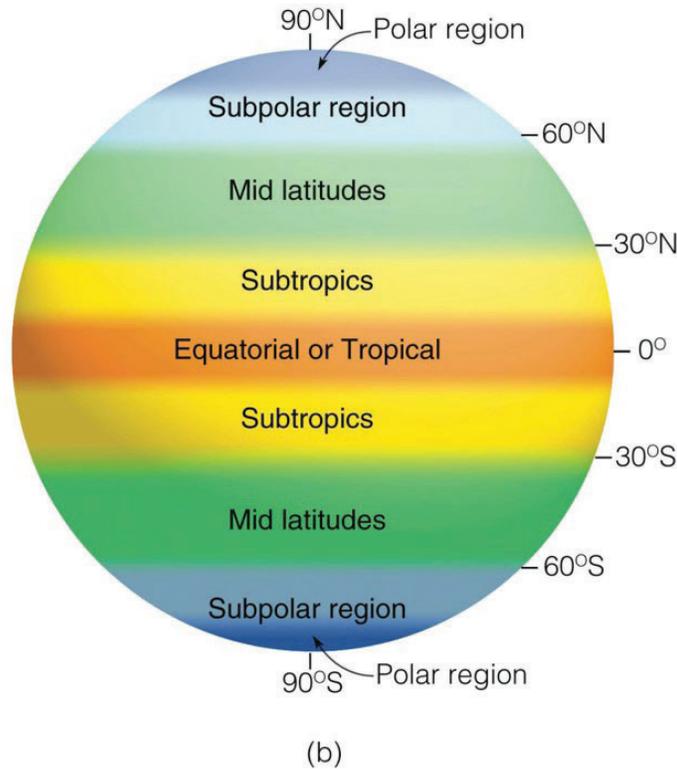

The region exposed to the most sunlight shifts North and South over the course of the year.

The temperature contrast between tropics and the poles maximizes in winter.

Fig 7.24: *Essentials of Meteorology* 7

Thermal Wind

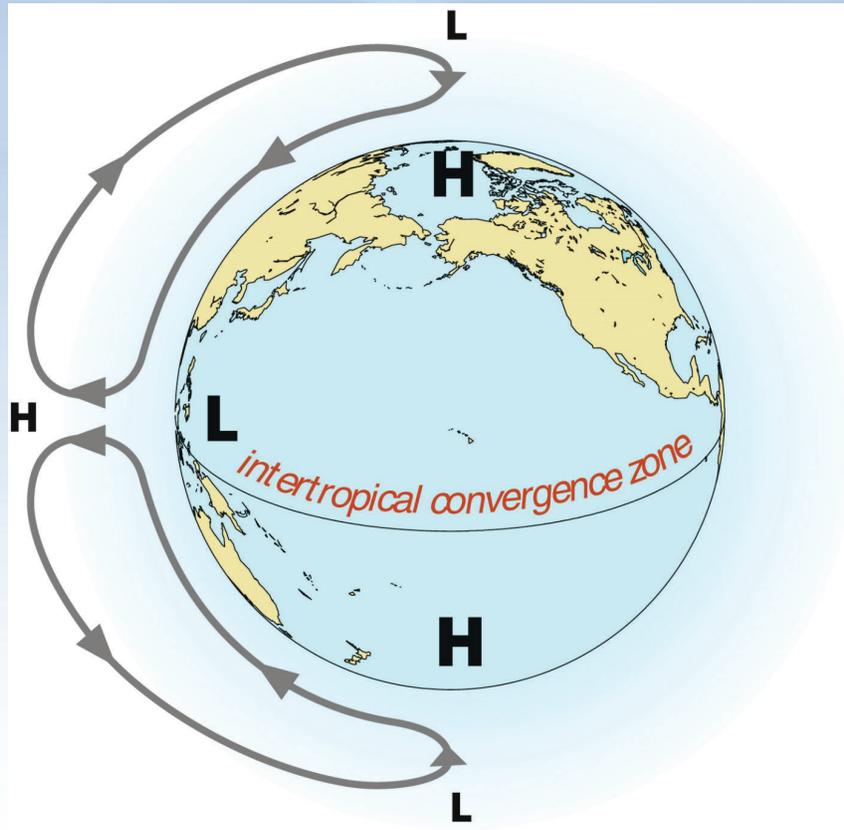

The air that moves poleward eventually sinks and creates high pressure at the surface

A pressure gradient at the surface completes the circuit and the surface air heads back to the equator

The Jet Streams

Tropopause height decreases as you move toward Pole

© Cengage Learning. All Rights Reserved.

Jet Streams form where the fronts meet

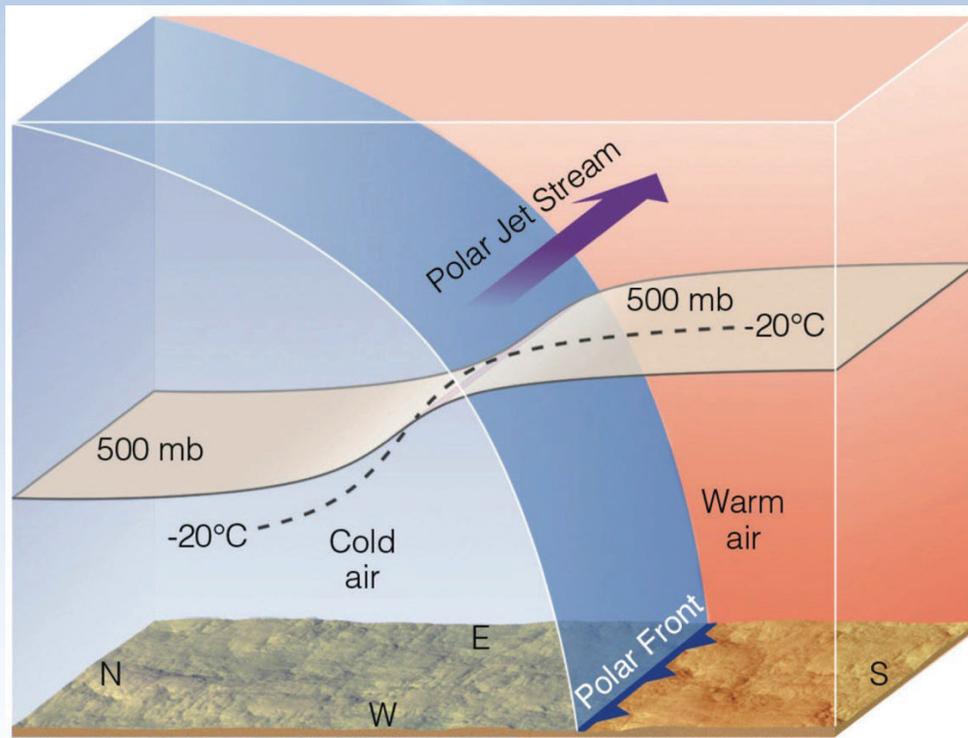

Wind speeds greater than 100 mph

Notice: the fronts are slanted toward the N. Pole

Copyright © 2019 University of Maryland

This material may not be reproduced or redistributed, in whole or in part, without written permission from Tim Canty

The Polar Jet Streams

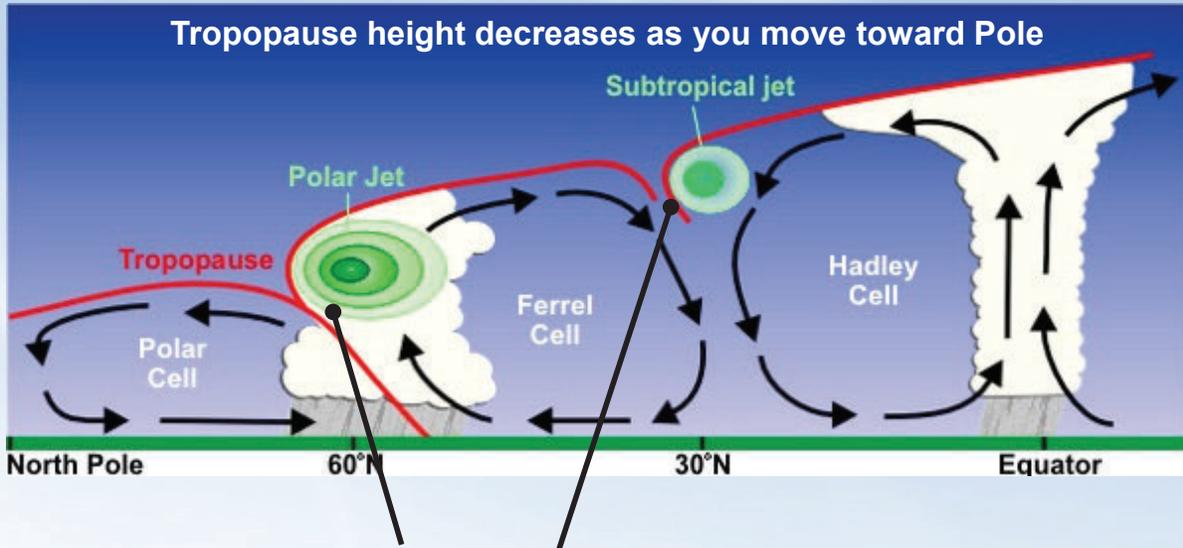

(a) 3-D view

This material may not be reproduced or redistributed, in whole or in part, without written permission from Tim Canty

The Jet Streams

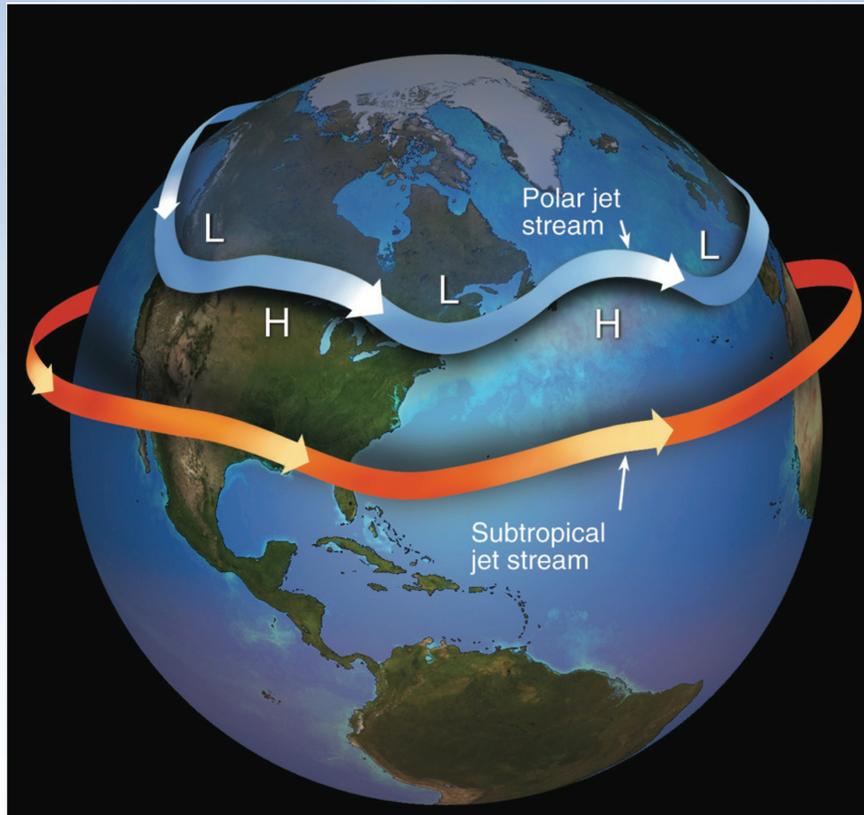

Pressure Gradient Force will push the air from south to north, Coriolis forces will move it to the right in the N. Hemisphere.

Fig 7.33: *Essentials of Meteorology*, 20

Convection

When air converges at a surface low pressure system, it can get pushed up and condense

What happens when air sinks toward a surface high pressure system?

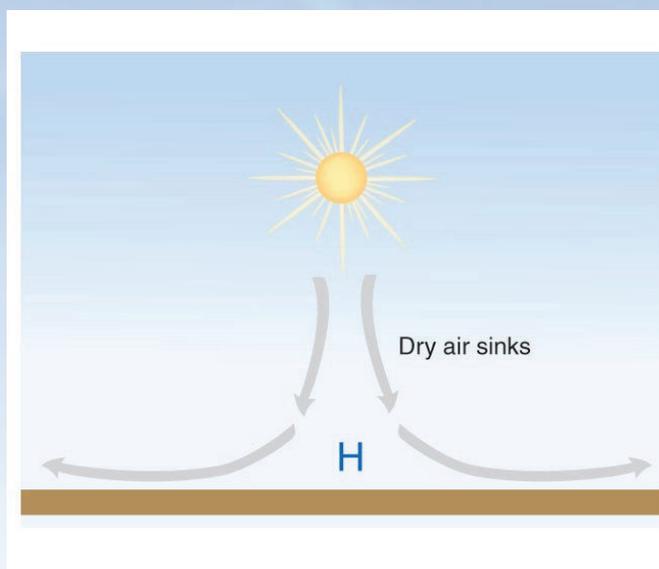

Fig 6-24 *Meteorology: Understanding the Atmosphere*

21

Subsidence

The air will warm as it sinks and gets drier

This sinking air will also inhibit convection

Fig 9.9 *Weather: A Concise Introduction*

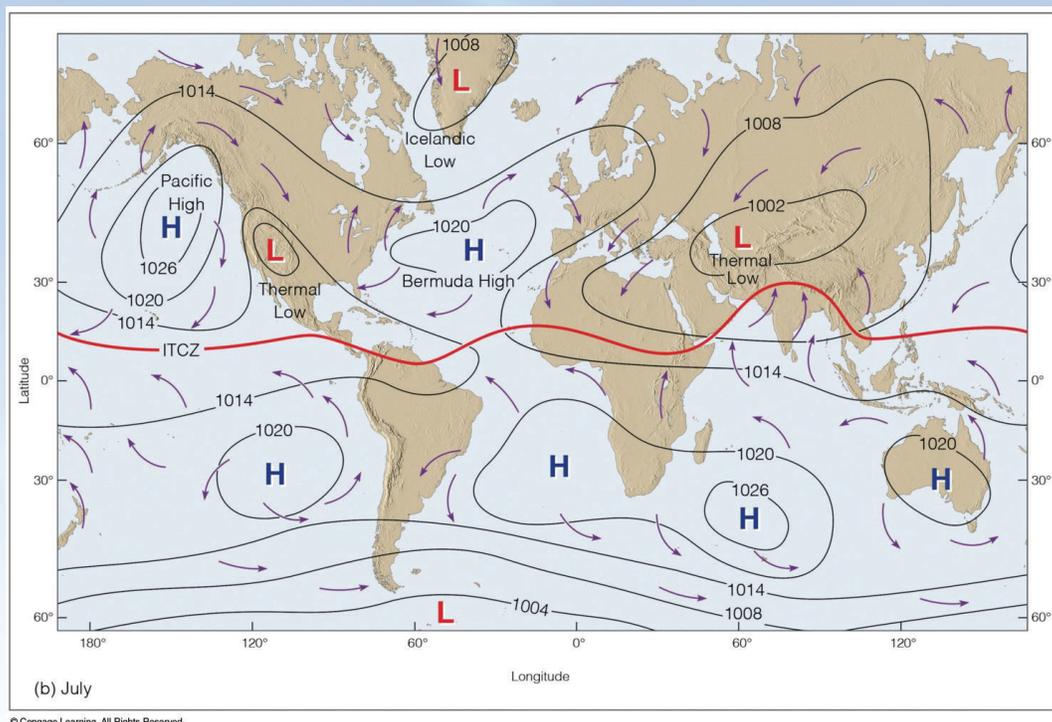

24

ITCZ

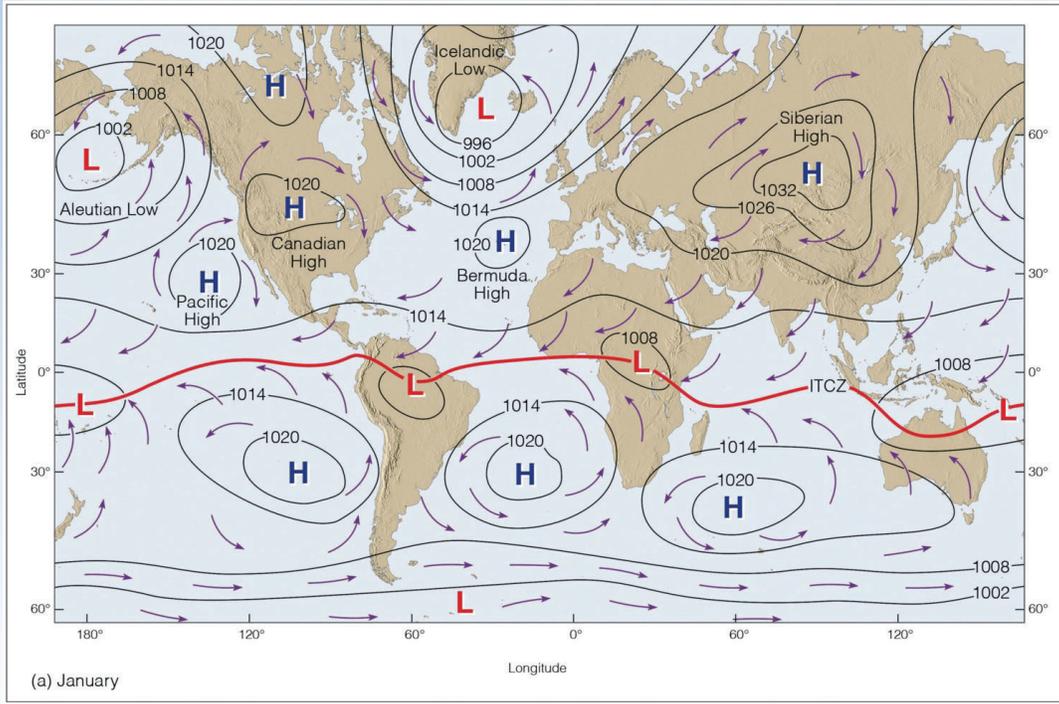

The region where the trade winds meet, near the Equator is called the **Inter-tropical Convergence Zone (ITCZ)**

Sea-level pressure in Summer

Low pressure systems form over land in N.H. summer: Thermal Lows
ITCZ has moved northward
Similar pattern develops in S.H during summer

Sea-level pressure in Winter

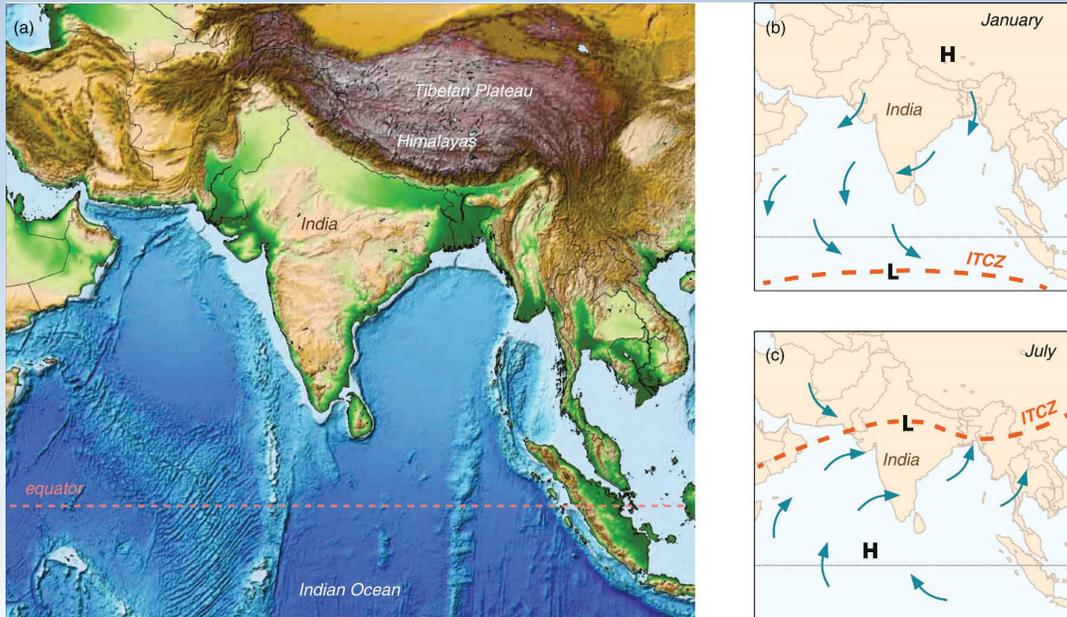

(a) January

Fig 7.28: *Essentials of Meteorology* 27

Monsoon

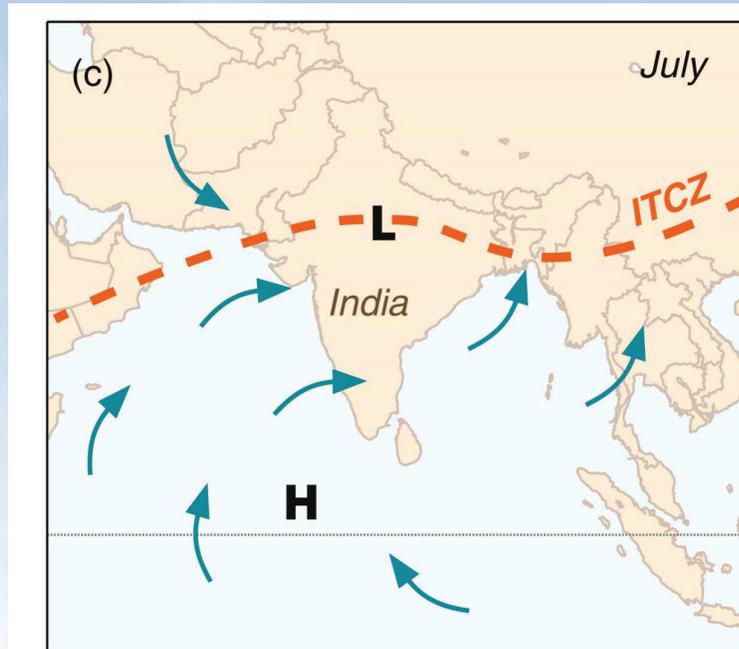

ITCZ shifts northward
Land heats up and pressure gradient forms, wind blows from ocean to land
Wind brings moist air from ocean, which condenses and rains out over land
Himalayas force air up leading to additional rainfall

Copyright © 2019 University of Maryland
 This material may not be reproduced or redistributed, in whole or in part, without written permission from Tim Canty

Fig 9.17 *Weather: A Concise Introduction* 28

Monsoon

ITCZ shifts northward

Land heats up and pressure gradient forms, wind blows from ocean to land

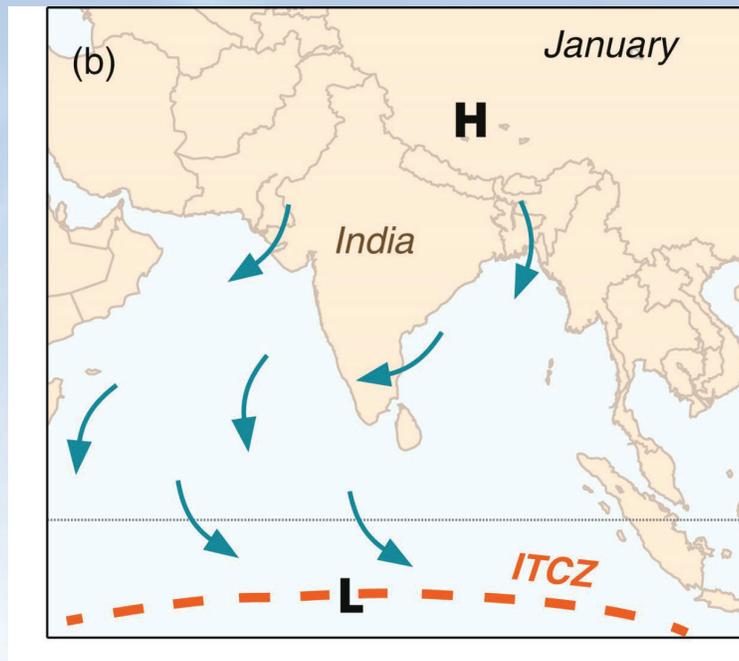

Wind brings moist air from ocean, which condenses and rains out over land

Himalayas force air up leading to additional rainfall

Fig 9.17 *Weather: A Concise Introduction* 29

Monsoon

Aloft air descends over water, picks up more moisture, completes cycle.

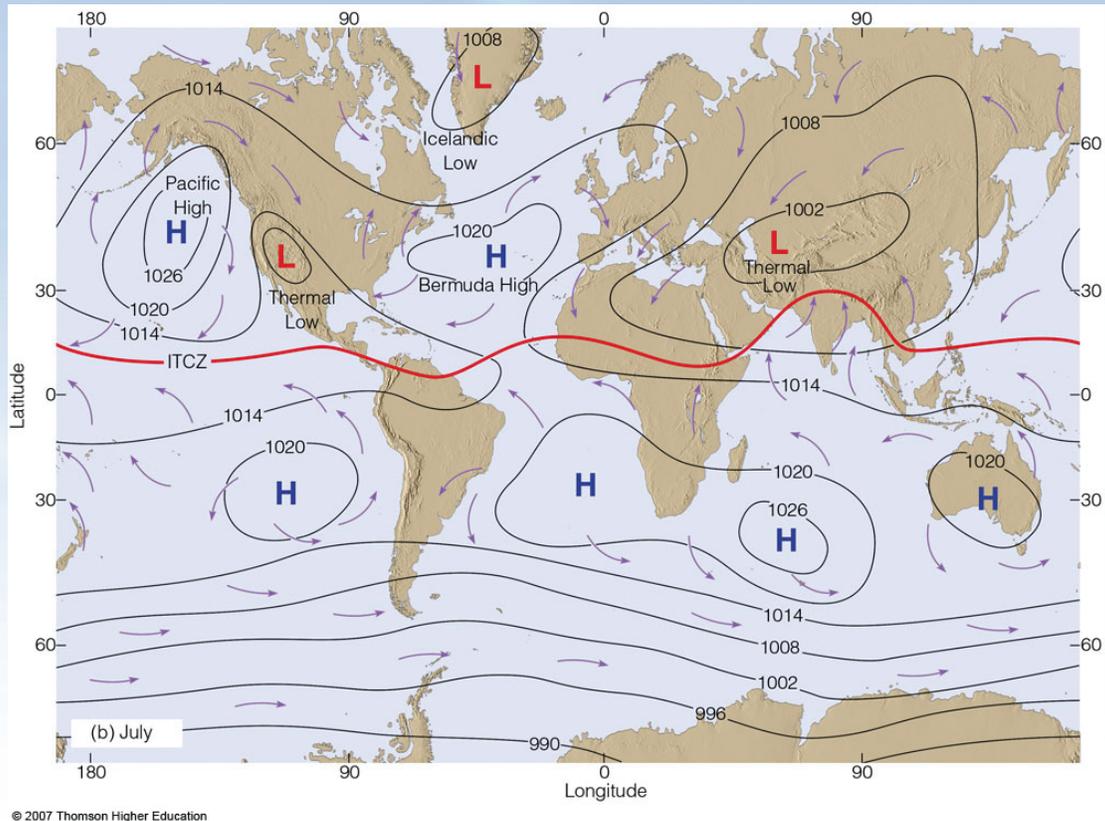

In fall and winter, ITCZ moves south

Wind flow is reversed, winter monsoon is dry
